[8559] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM620 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8560] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 621 (GAM621) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8561] GAM621 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM621 was detected is described hereinabove with reference to Figs. 2-8.

[8562] GAM621 gene, herein designated GAM GENE, and GAM621 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[8563] GAM621 gene, herein designated GAM GENE, encodes a GAM621 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM621 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM621 precursor RNA is designated SEQ ID:598, and is provided hereinbelow with reference to the sequence listing part.

[8564] GAM621 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM621 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8565] An enzyme complex designated DICER COMPLEX, dices the GAM621 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM621 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM621 RNA is designated SEQ ID:3198, and is provided

hereinbelow with reference to the sequence listing part.

[8566] GAM621 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM621 target RNA, herein designated GAM TARGET RNA. GAM621 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8567] GAM621 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM621 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM621 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM621 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM621 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8568] The complementary binding of GAM621 RNA, herein designated GAM RNA, to target binding sites on GAM621 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM621 target RNA, herein designated GAM TARGET RNA, into GAM621 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8569] It is appreciated that GAM621 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM621 target genes. The mRNA of each one of this plurality of GAM621 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM621 RNA, herein designated GAM RNA, and which when bound by GAM621 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM621 target proteins.

[8570] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM621 gene, herein designated GAM GENE, on one or more GAM621 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8571] It is yet further appreciated that specific functions, and accordingly utilities, of GAM621 correlate with, and may be deduced from, the identity of the target genes which GAM621 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8572] Nucleotide sequences of the GAM621 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM621 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM621 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM621 are further described hereinbelow with reference to Table 1.

[8573] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM621 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8574] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 622 (GAM622) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8575] GAM622 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM622 was detected is

described hereinabove with reference to Figs. 2-8.

[8576] GAM622 gene, herein designated GAM GENE, and GAM622 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8577] GAM622 gene, herein designated GAM GENE, encodes a GAM622 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM622 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM622 precursor RNA is designated SEQ ID:599, and is provided hereinbelow with reference to the sequence listing part.

[8578] GAM622 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8579] An enzyme complex designated DICER COMPLEX, dices the GAM622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM622 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM622 RNA is designated SEQ ID:3199, and is provided hereinbelow with reference to the sequence listing part.

[8580] GAM622 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM622 target RNA, herein designated GAM TARGET RNA. GAM622 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8581] GAM622 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM622 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM622 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM622 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM622 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8582] The complementary binding of GAM622 RNA, herein designated GAM RNA, to target binding sites on GAM622 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM622 target RNA, herein designated GAM TARGET RNA, into GAM622 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8583] It is appreciated that GAM622 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM622 target genes. The mRNA of each one of this plurality of GAM622 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM622 RNA, herein designated GAM RNA, and which when bound by GAM622 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM622 target proteins.

[8584] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM622 gene, herein designated GAM GENE, on one or more GAM622 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8585] It is yet further appreciated that specific functions, and accordingly utilities, of GAM622 correlate with, and may be deduced from, the identity of the target genes which GAM622 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8586] Nucleotide sequences of the GAM622 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM622 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM622 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM622 are further described hereinbelow with reference to Table 1.

[8587] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM622 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8588] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 623 (GAM623) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8589] GAM623 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM623 was detected is described hereinabove with reference to Figs. 2-8.

[8590] GAM623 gene, herein designated GAM GENE, and GAM623 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8591] GAM623 gene, herein designated GAM GENE, encodes a GAM623 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM623 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM623 precursor RNA is designated SEQ ID:600, and is provided hereinbelow with reference to the sequence listing part.

[8592] GAM623 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM623 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8593] An enzyme complex designated DICER COMPLEX, dices the GAM623 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM623 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM623 RNA is designated SEQ ID:3202, and is provided hereinbelow with reference to the sequence listing part.

[8594] GAM623 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM623 target RNA, herein designated GAM TARGET RNA. GAM623 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8595] GAM623 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM623 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM623 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM623 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM623 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8596] The complementary binding of GAM623 RNA, herein designated GAM RNA, to target binding sites on GAM623 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM623 target RNA, herein designated GAM TARGET RNA, into GAM623 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8597] It is appreciated that GAM623 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM623 target genes. The mRNA of each one of this plurality of GAM623 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM623 RNA, herein designated GAM RNA, and which when bound by GAM623 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM623 target proteins.

[8598] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM623 gene, herein designated GAM GENE, on one or more GAM623 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8599] It is yet further appreciated that specific functions, and accordingly utilities, of GAM623 correlate with, and may be deduced from, the identity of the target genes which GAM623 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8600] Nucleotide sequences of the GAM623 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM623 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM623 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM623 are further described hereinbelow with reference to Table 1.

[8601] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM623 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8602]

[8603] Fig. 8 further provides a conceptual description of a novel bioinformatically

detected gene of the present invention, referred to here as Genomic Address Messenger 624 (GAM624) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8604] GAM624 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM624 was detected is described hereinabove with reference to Figs. 2-8.

[8605] GAM624 gene, herein designated GAM GENE, and GAM624 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8606] GAM624 gene, herein designated GAM GENE, encodes a GAM624 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM624 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM624 precursor RNA is designated SEQ ID:601, and is provided hereinbelow with reference to the sequence listing part.

[8607] GAM624 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM624 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence

of the second half thereof.

[8608] An enzyme complex designated DICER COMPLEX, dices the GAM624 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM624 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM624 RNA is designated SEQ ID:3200, and is provided hereinbelow with reference to the sequence listing part.

[8609] GAM624 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM624 target RNA, herein designated GAM TARGET RNA. GAM624 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8610] GAM624 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM624 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM624 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING

SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM624 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM624 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8611] The complementary binding of GAM624 RNA, herein designated GAM RNA, to target binding sites on GAM624 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM624 target RNA, herein designated GAM TARGET RNA, into GAM624 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8612] It is appreciated that GAM624 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM624 target genes. The mRNA of each one of this plurality of GAM624 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM624 RNA, herein designated GAM RNA, and which when bound by GAM624 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM624 target proteins.

[8613] It is further appreciated by one skilled in the art that the mode of translational

inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM624 gene, herein designated GAM GENE, on one or more GAM624 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8614] It is yet further appreciated that specific functions, and accordingly utilities, of GAM624 correlate with, and may be deduced from, the identity of the target genes which GAM624 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8615] Nucleotide sequences of the GAM624 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM624 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM624 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM624 are further described hereinbelow with reference to Table 1.

[8616] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to

GAM624 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8617] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 625 (GAM625) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8618] GAM625 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM625 was detected is described hereinabove with reference to Figs. 2-8.

[8619] GAM625 gene, herein designated GAM GENE, and GAM625 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8620] GAM625 gene, herein designated GAM GENE, encodes a GAM625 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM625 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM625 precursor RNA is designated SEQ ID:602, and is provided hereinbelow with reference to the sequence listing part.

[8621] GAM625 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM625 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin

structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8622] An enzyme complex designated DICER COMPLEX, dices the GAM625 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM625 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM625 RNA is designated SEQ ID:3201, and is provided hereinbelow with reference to the sequence listing part.

[8623] GAM625 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM625 target RNA, herein designated GAM TARGET RNA. GAM625 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8624] GAM625 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM625 target RNA, herein designated GAM TARGET RNA. This complementary

binding is due to the fact that the nucleotide sequence of GAM625 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM625 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM625 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8625] The complementary binding of GAM625 RNA, herein designated GAM RNA, to target binding sites on GAM625 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM625 target RNA, herein designated GAM TARGET RNA, into GAM625 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8626] It is appreciated that GAM625 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM625 target genes. The mRNA of each one of this plurality of GAM625 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM625 RNA, herein designated GAM RNA, and

which when bound by GAM625 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM625 target proteins.

[8627] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM625 gene, herein designated GAM GENE, on one or more GAM625 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8628] It is yet further appreciated that specific functions, and accordingly utilities, of GAM625 correlate with, and may be deduced from, the identity of the target genes which GAM625 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8629] Nucleotide sequences of the GAM625 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM625 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM625 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM625 are further described hereinbelow with reference to Table 1.

[8630] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM625 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8631] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 626 (GAM626) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8632] GAM626 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM626 was detected is described hereinabove with reference to Figs. 2-8.

[8633] GAM626 gene, herein designated GAM GENE, and GAM626 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8634] GAM626 gene, herein designated GAM GENE, encodes a GAM626 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM626 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM626 precursor RNA is designated SEQ ID:603, and is provided hereinbelow with reference to the sequence listing part.

[8635] GAM626 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8636] An enzyme complex designated DICER COMPLEX, dices the GAM626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM626 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM626 RNA is designated SEQ ID:3203, and is provided hereinbelow with reference to the sequence listing part.

[8637] GAM626 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM626 target RNA, herein designated GAM TARGET RNA. GAM626 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8638] GAM626 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM626 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM626 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM626 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM626 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8639] The complementary binding of GAM626 RNA, herein designated GAM RNA, to target binding sites on GAM626 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM626 target RNA, herein designated GAM TARGET RNA, into GAM626 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8640] It is appreciated that GAM626 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM626 target genes. The mRNA of

each one of this plurality of GAM626 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM626 RNA, herein designated GAM RNA, and which when bound by GAM626 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM626 target proteins.

[8641] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM626 gene, herein designated GAM GENE, on one or more GAM626 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8642] It is yet further appreciated that specific functions, and accordingly utilities, of GAM626 correlate with, and may be deduced from, the identity of the target genes which GAM626 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8643] Nucleotide sequences of the GAM626 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM626 RNA, herein designated GAM RNA, and a schematic representation of the secondary

folding of GAM626 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM626 are further described hereinbelow with reference to Table 1.

[8644] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM626 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8645] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 627 (GAM627) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8646] GAM627 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM627 was detected is described hereinabove with reference to Figs. 2-8.

[8647] GAM627 gene, herein designated GAM GENE, and GAM627 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8648] GAM627 gene, herein designated GAM GENE, encodes a GAM627 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM627 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of GAM627 precursor RNA is designated SEQ ID:604, and is provided hereinbelow with reference to the sequence listing part.

[8649] GAM627 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM627 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8650] An enzyme complex designated DICER COMPLEX, dices the GAM627 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM627 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM627 RNA is designated SEQ ID:3205, and is provided hereinbelow with reference to the sequence listing part.

[8651] GAM627 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM627 target RNA, herein designated GAM TARGET RNA. GAM627 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein

coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8652] GAM627 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM627 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM627 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM627 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM627 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8653] The complementary binding of GAM627 RNA, herein designated GAM RNA, to target binding sites on GAM627 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM627 target RNA, herein designated GAM TARGET RNA, into GAM627 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken

line.

[8654] It is appreciated that GAM627 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM627 target genes. The mRNA of each one of this plurality of GAM627 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM627 RNA, herein designated GAM RNA, and which when bound by GAM627 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM627 target proteins.

[8655] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM627 gene, herein designated GAM GENE, on one or more GAM627 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8656] It is yet further appreciated that specific functions, and accordingly utilities, of GAM627 correlate with, and may be deduced from, the identity of the target genes which GAM627 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8657] Nucleotide sequences of the GAM627 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM627 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM627 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM627 are further described hereinbelow with reference to Table 1.

[8658] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM627 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8659] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 628 (GAM628) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8660] GAM628 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM628 was detected is described hereinabove with reference to Figs. 2-8.

[8661] GAM628 gene, herein designated GAM GENE, and GAM628 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8662] GAM628 gene, herein designated GAM GENE, encodes a GAM628

precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM628 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM628 precursor RNA is designated SEQ ID:605, and is provided hereinbelow with reference to the sequence listing part.

[8663] GAM628 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8664] An enzyme complex designated DICER COMPLEX, dices the GAM628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM628 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM628 RNA is designated SEQ ID:3204, and is provided hereinbelow with reference to the sequence listing part.

[8665] GAM628 target gene, herein designated GAM TARGET GENE, encodes a

corresponding messenger RNA, GAM628 target RNA, herein designated GAM TARGET RNA. GAM628 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8666] GAM628 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM628 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM628 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM628 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM628 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8667] The complementary binding of GAM628 RNA, herein designated GAM RNA, to target binding sites on GAM628 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING

SITE III, inhibits translation of GAM628 target RNA, herein designated GAM TARGET RNA, into GAM628 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8668] It is appreciated that GAM628 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM628 target genes. The mRNA of each one of this plurality of GAM628 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM628 RNA, herein designated GAM RNA, and which when bound by GAM628 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM628 target proteins.

[8669] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM628 gene, herein designated GAM GENE, on one or more GAM628 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8670] It is yet further appreciated that specific functions, and accordingly utilities, of

GAM628 correlate with, and may be deduced from, the identity of the target genes which GAM628 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8671] Nucleotide sequences of the GAM628 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM628 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM628 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM628 are further described hereinbelow with reference to Table 1.

[8672] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM628 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8673] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 629 (GAM629) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8674] GAM629 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM629 was detected is described hereinabove with reference to Figs. 2-8.

[8675] GAM629 gene, herein designated GAM GENE, and GAM629 target gene,

herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8676] GAM629 gene, herein designated GAM GENE, encodes a GAM629 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM629 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM629 precursor RNA is designated SEQ ID:606, and is provided hereinbelow with reference to the sequence listing part.

[8677] GAM629 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8678] An enzyme complex designated DICER COMPLEX, dices the GAM629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM629 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide

sequence of GAM629 RNA is designated SEQ ID:3206, and is provided hereinbelow with reference to the sequence listing part.

[8679] GAM629 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM629 target RNA, herein designated GAM TARGET RNA. GAM629 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8680] GAM629 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM629 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM629 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM629 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM629 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8681] The complementary binding of GAM629 RNA, herein designated GAM RNA, to target binding sites on GAM629 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM629 target RNA, herein designated GAM TARGET RNA, into GAM629 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8682] It is appreciated that GAM629 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM629 target genes. The mRNA of each one of this plurality of GAM629 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM629 RNA, herein designated GAM RNA, and which when bound by GAM629 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM629 target proteins.

[8683] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM629 gene, herein designated GAM GENE, on one or more GAM629 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8684] It is yet further appreciated that specific functions, and accordingly utilities, of GAM629 correlate with, and may be deduced from, the identity of the target genes which GAM629 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8685] Nucleotide sequences of the GAM629 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM629 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM629 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM629 are further described hereinbelow with reference to Table 1.

[8686] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM629 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8687] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 630 (GAM630) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8688] GAM630 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM630 was detected is

described hereinabove with reference to Figs. 2-8.

[8689] GAM630 gene, herein designated GAM GENE, and GAM630 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8690] GAM630 gene, herein designated GAM GENE, encodes a GAM630 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM630 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM630 precursor RNA is designated SEQ ID:607, and is provided hereinbelow with reference to the sequence listing part.

[8691] GAM630 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8692] An enzyme complex designated DICER COMPLEX, dices the GAM630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM630 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM630 RNA is designated SEQ ID:3207, and is provided hereinbelow with reference to the sequence listing part.

[8693] GAM630 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM630 target RNA, herein designated GAM TARGET RNA. GAM630 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8694] GAM630 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM630 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM630 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM630 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM630 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8695] The complementary binding of GAM630 RNA, herein designated GAM RNA, to target binding sites on GAM630 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM630 target RNA, herein designated GAM TARGET RNA, into GAM630 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8696] It is appreciated that GAM630 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM630 target genes. The mRNA of each one of this plurality of GAM630 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM630 RNA, herein designated GAM RNA, and which when bound by GAM630 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM630 target proteins.

[8697] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM630 gene, herein designated GAM GENE, on one or more GAM630 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8698] It is yet further appreciated that specific functions, and accordingly utilities, of GAM630 correlate with, and may be deduced from, the identity of the target genes which GAM630 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8699] Nucleotide sequences of the GAM630 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM630 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM630 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM630 are further described hereinbelow with reference to Table 1.

[8700] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM630 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8701] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 631 (GAM631) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8702] GAM631 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM631 was detected is described hereinabove with reference to Figs. 2-8.

[8703] GAM631 gene, herein designated GAM GENE, and GAM631 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8704] GAM631 gene, herein designated GAM GENE, encodes a GAM631 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM631 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM631 precursor RNA is designated SEQ ID:608, and is provided hereinbelow with reference to the sequence listing part.

[8705] GAM631 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8706] An enzyme complex designated DICER COMPLEX, dices the GAM631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM631 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM631 RNA is designated SEQ ID:3208, and is provided hereinbelow with reference to the sequence listing part.

[8707] GAM631 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM631 target RNA, herein designated GAM TARGET RNA. GAM631 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8708] GAM631 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM631 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM631 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM631 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM631 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8709] The complementary binding of GAM631 RNA, herein designated GAM RNA, to target binding sites on GAM631 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM631 target RNA, herein designated GAM TARGET RNA, into GAM631 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8710] It is appreciated that GAM631 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM631 target genes. The mRNA of each one of this plurality of GAM631 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM631 RNA, herein designated GAM RNA, and which when bound by GAM631 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM631 target proteins.

[8711] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM631 gene, herein designated GAM GENE, on one or more GAM631 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8712] It is yet further appreciated that specific functions, and accordingly utilities, of GAM631 correlate with, and may be deduced from, the identity of the target genes which GAM631 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8713] Nucleotide sequences of the GAM631 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM631 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM631 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM631 are further described hereinbelow with reference to Table 1.

[8714] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM631 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8715] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 632 (GAM632) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8716] GAM632 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM632 was detected is described hereinabove with reference to Figs. 2-8.

[8717] GAM632 gene, herein designated GAM GENE, and GAM632 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8718] GAM632 gene, herein designated GAM GENE, encodes a GAM632 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM632 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM632 precursor RNA is designated SEQ ID:609, and is provided hereinbelow with reference to the sequence listing part.

[8719] GAM632 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8720] An enzyme complex designated DICER COMPLEX, dices the GAM632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM632 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM632 RNA is designated SEQ ID:3209, and is provided hereinbelow with reference to the sequence listing part.

[8721] GAM632 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM632 target RNA, herein designated GAM TARGET RNA. GAM632 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8722] GAM632 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM632 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM632 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM632 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM632 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8723] The complementary binding of GAM632 RNA, herein designated GAM RNA, to target binding sites on GAM632 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM632 target RNA, herein designated GAM TARGET RNA, into GAM632 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8724] It is appreciated that GAM632 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM632 target genes. The mRNA of each one of this plurality of GAM632 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM632 RNA, herein designated GAM RNA, and which when bound by GAM632 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM632 target proteins.

[8725] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM632 gene, herein designated GAM GENE, on one or more

GAM632 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8726] It is yet further appreciated that specific functions, and accordingly utilities, of GAM632 correlate with, and may be deduced from, the identity of the target genes which GAM632 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8727] Nucleotide sequences of the GAM632 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM632 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM632 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM632 are further described hereinbelow with reference to Table 1.

[8728] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM632 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8729] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 633 (GAM633) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8730] GAM633 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM633 was detected is described hereinabove with reference to Figs. 2-8.

[8731] GAM633 gene, herein designated GAM GENE, and GAM633 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8732] GAM633 gene, herein designated GAM GENE, encodes a GAM633 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM633 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM633 precursor RNA is designated SEQ ID:610, and is provided hereinbelow with reference to the sequence listing part.

[8733] GAM633 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8734] An enzyme complex designated DICER COMPLEX, dices the GAM633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM633 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM633 RNA is designated SEQ ID:3210, and is provided hereinbelow with reference to the sequence listing part.

[8735] GAM633 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM633 target RNA, herein designated GAM TARGET RNA. GAM633 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8736] GAM633 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM633 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM633 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM633 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM633 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8737] The complementary binding of GAM633 RNA, herein designated GAM RNA, to target binding sites on GAM633 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM633 target RNA, herein designated GAM TARGET RNA, into GAM633 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8738] It is appreciated that GAM633 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM633 target genes. The mRNA of each one of this plurality of GAM633 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM633 RNA, herein designated GAM RNA, and which when bound by GAM633 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM633 target proteins.

[8739] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM633 gene, herein designated GAM GENE, on one or more GAM633 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8740] It is yet further appreciated that specific functions, and accordingly utilities, of GAM633 correlate with, and may be deduced from, the identity of the target genes which GAM633 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8741] Nucleotide sequences of the GAM633 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM633 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM633 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM633 are further described hereinbelow with reference to Table 1.

[8742] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM633 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8743] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 634 (GAM634) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8744] GAM634 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM634 was detected is described hereinabove with reference to Figs. 2-8.

[8745] GAM634 gene, herein designated GAM GENE, and GAM634 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8746] GAM634 gene, herein designated GAM GENE, encodes a GAM634 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM634 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM634 precursor RNA is designated SEQ ID:611, and is provided hereinbelow with reference to the sequence listing part.

[8747] GAM634 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM634 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8748] An enzyme complex designated DICER COMPLEX, dices the GAM634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM634 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM634 RNA is designated SEQ ID:3211, and is provided hereinbelow with reference to the sequence listing part.

[8749] GAM634 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM634 target RNA, herein designated GAM TARGET RNA. GAM634 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8750] GAM634 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM634

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM634 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM634 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM634 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8751] The complementary binding of GAM634 RNA, herein designated GAM RNA, to target binding sites on GAM634 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM634 target RNA, herein designated GAM TARGET RNA, into GAM634 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8752] It is appreciated that GAM634 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM634 target genes. The mRNA of each one of this plurality of GAM634 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM634 RNA, herein designated GAM RNA, and which when bound by GAM634 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM634 target proteins.

[8753] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM634 gene, herein designated GAM GENE, on one or more GAM634 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8754] It is yet further appreciated that specific functions, and accordingly utilities, of GAM634 correlate with, and may be deduced from, the identity of the target genes which GAM634 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8755] Nucleotide sequences of the GAM634 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM634 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM634 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM634 are further described hereinbelow with

reference to Table 1.

[8756] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM634 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8757] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 635 (GAM635) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8758] GAM635 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM635 was detected is described hereinabove with reference to Figs. 2-8.

[8759] GAM635 gene, herein designated GAM GENE, and GAM635 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8760] GAM635 gene, herein designated GAM GENE, encodes a GAM635 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM635 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM635 precursor RNA is designated SEQ ID:612, and is provided

hereinbelow with reference to the sequence listing part.

[8761] GAM635 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM635 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8762] An enzyme complex designated DICER COMPLEX, dices the GAM635 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM635 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM635 RNA is designated SEQ ID:3213, and is provided hereinbelow with reference to the sequence listing part.

[8763] GAM635 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM635 target RNA, herein designated GAM TARGET RNA. GAM635 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[8764] GAM635 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM635 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM635 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM635 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM635 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8765] The complementary binding of GAM635 RNA, herein designated GAM RNA, to target binding sites on GAM635 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM635 target RNA, herein designated GAM TARGET RNA, into GAM635 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8766] It is appreciated that GAM635 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM635 target genes. The mRNA of each one of this plurality of GAM635 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM635 RNA, herein designated GAM RNA, and which when bound by GAM635 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM635 target proteins.

[8767] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM635 gene, herein designated GAM GENE, on one or more GAM635 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8768] It is yet further appreciated that specific functions, and accordingly utilities, of GAM635 correlate with, and may be deduced from, the identity of the target genes which GAM635 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8769] Nucleotide sequences of the GAM635 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM635 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM635 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM635 are further described hereinbelow with reference to Table 1.

[8770] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM635 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8771] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 636 (GAM636) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8772] GAM636 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM636 was detected is described hereinabove with reference to Figs. 2-8.

[8773] GAM636 gene, herein designated GAM GENE, and GAM636 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8774] GAM636 gene, herein designated GAM GENE, encodes a GAM636 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM636 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM636 precursor RNA is designated SEQ ID:613, and is provided hereinbelow with reference to the sequence listing part.

[8775] GAM636 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8776] An enzyme complex designated DICER COMPLEX, dices the GAM636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM636 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM636 RNA is designated SEQ ID:3212, and is provided hereinbelow with reference to the sequence listing part.

[8777] GAM636 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM636 target RNA, herein designated

GAM TARGET RNA. GAM636 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8778] GAM636 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM636 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM636 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM636 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM636 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8779] The complementary binding of GAM636 RNA, herein designated GAM RNA, to target binding sites on GAM636 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM636 target RNA, herein designated GAM

TARGET RNA, into GAM636 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8780] It is appreciated that GAM636 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM636 target genes. The mRNA of each one of this plurality of GAM636 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM636 RNA, herein designated GAM RNA, and which when bound by GAM636 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM636 target proteins.

[8781] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM636 gene, herein designated GAM GENE, on one or more GAM636 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8782] It is yet further appreciated that specific functions, and accordingly utilities, of GAM636 correlate with, and may be deduced from, the identity of the target

genes which GAM636 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8783] Nucleotide sequences of the GAM636 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM636 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM636 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM636 are further described hereinbelow with reference to Table 1.

[8784] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM636 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8785] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 637 (GAM637) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8786] GAM637 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM637 was detected is described hereinabove with reference to Figs. 2-8.

[8787] GAM637 gene, herein designated GAM GENE, and GAM637 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[8788] GAM637 gene, herein designated GAM GENE, encodes a GAM637 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM637 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM637 precursor RNA is designated SEQ ID:614, and is provided hereinbelow with reference to the sequence listing part.

[8789] GAM637 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM637 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8790] An enzyme complex designated DICER COMPLEX, dices the GAM637 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM637 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM637 RNA is designated SEQ ID:3214, and is provided

hereinbelow with reference to the sequence listing part.

[8791] GAM637 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM637 target RNA, herein designated GAM TARGET RNA. GAM637 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8792] GAM637 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM637 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM637 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM637 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM637 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8793] The complementary binding of GAM637 RNA, herein designated GAM RNA, to target binding sites on GAM637 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM637 target RNA, herein designated GAM TARGET RNA, into GAM637 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8794] It is appreciated that GAM637 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM637 target genes. The mRNA of each one of this plurality of GAM637 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM637 RNA, herein designated GAM RNA, and which when bound by GAM637 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM637 target proteins.

[8795] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM637 gene, herein designated GAM GENE, on one or more GAM637 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8796] It is yet further appreciated that specific functions, and accordingly utilities, of GAM637 correlate with, and may be deduced from, the identity of the target genes which GAM637 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8797] Nucleotide sequences of the GAM637 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM637 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM637 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM637 are further described hereinbelow with reference to Table 1.

[8798] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM637 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8799] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 638 (GAM638) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8800] GAM638 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM638 was detected is

described hereinabove with reference to Figs. 2-8.

[8801] GAM638 gene, herein designated GAM GENE, and GAM638 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8802] GAM638 gene, herein designated GAM GENE, encodes a GAM638 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM638 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM638 precursor RNA is designated SEQ ID:615, and is provided hereinbelow with reference to the sequence listing part.

[8803] GAM638 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8804] An enzyme complex designated DICER COMPLEX, dices the GAM638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM638 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM638 RNA is designated SEQ ID:3215, and is provided hereinbelow with reference to the sequence listing part.

[8805] GAM638 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM638 target RNA, herein designated GAM TARGET RNA. GAM638 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8806] GAM638 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM638 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM638 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM638 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM638 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8807] The complementary binding of GAM638 RNA, herein designated GAM RNA, to target binding sites on GAM638 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM638 target RNA, herein designated GAM TARGET RNA, into GAM638 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8808] It is appreciated that GAM638 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM638 target genes. The mRNA of each one of this plurality of GAM638 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM638 RNA, herein designated GAM RNA, and which when bound by GAM638 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM638 target proteins.

[8809] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM638 gene, herein designated GAM GENE, on one or more GAM638 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8810] It is yet further appreciated that specific functions, and accordingly utilities, of GAM638 correlate with, and may be deduced from, the identity of the target genes which GAM638 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8811] Nucleotide sequences of the GAM638 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM638 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM638 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM638 are further described hereinbelow with reference to Table 1.

[8812] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM638 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8813] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 639 (GAM639) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8814] GAM639 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM639 was detected is described hereinabove with reference to Figs. 2-8.

[8815] GAM639 gene, herein designated GAM GENE, and GAM639 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8816] GAM639 gene, herein designated GAM GENE, encodes a GAM639 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM639 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM639 precursor RNA is designated SEQ ID:616, and is provided hereinbelow with reference to the sequence listing part.

[8817] GAM639 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM639 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8818] An enzyme complex designated DICER COMPLEX, dices the GAM639 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM639 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM639 RNA is designated SEQ ID:3216, and is provided hereinbelow with reference to the sequence listing part.

[8819] GAM639 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM639 target RNA, herein designated GAM TARGET RNA. GAM639 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8820] GAM639 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM639 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM639 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM639 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM639 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8821] The complementary binding of GAM639 RNA, herein designated GAM RNA, to target binding sites on GAM639 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM639 target RNA, herein designated GAM TARGET RNA, into GAM639 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8822] It is appreciated that GAM639 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM639 target genes. The mRNA of each one of this plurality of GAM639 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM639 RNA, herein designated GAM RNA, and which when bound by GAM639 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM639 target proteins.

[8823] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM639 gene, herein designated GAM GENE, on one or more GAM639 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8824] It is yet further appreciated that specific functions, and accordingly utilities, of GAM639 correlate with, and may be deduced from, the identity of the target genes which GAM639 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8825] Nucleotide sequences of the GAM639 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM639 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM639 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM639 are further described hereinbelow with reference to Table 1.

[8826] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM639 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8827] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 640 (GAM640) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8828] GAM640 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM640 was detected is described hereinabove with reference to Figs. 2-8.

[8829] GAM640 gene, herein designated GAM GENE, and GAM640 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8830] GAM640 gene, herein designated GAM GENE, encodes a GAM640 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM640 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM640 precursor RNA is designated SEQ ID:617, and is provided hereinbelow with reference to the sequence listing part.

[8831] GAM640 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8832] An enzyme complex designated DICER COMPLEX, dices the GAM640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM640 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM640 RNA is designated SEQ ID:3217, and is provided hereinbelow with reference to the sequence listing part.

[8833] GAM640 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM640 target RNA, herein designated GAM TARGET RNA. GAM640 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8834] GAM640 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM640 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM640 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM640 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM640 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8835] The complementary binding of GAM640 RNA, herein designated GAM RNA, to target binding sites on GAM640 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM640 target RNA, herein designated GAM TARGET RNA, into GAM640 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8836] It is appreciated that GAM640 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM640 target genes. The mRNA of each one of this plurality of GAM640 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM640 RNA, herein designated GAM RNA, and which when bound by GAM640 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM640 target proteins.

[8837] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM640 gene, herein designated GAM GENE, on one or more

GAM640 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8838] It is yet further appreciated that specific functions, and accordingly utilities, of GAM640 correlate with, and may be deduced from, the identity of the target genes which GAM640 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8839] Nucleotide sequences of the GAM640 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM640 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM640 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM640 are further described hereinbelow with reference to Table 1.

[8840] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM640 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8841] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 641 (GAM641) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8842] GAM641 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM641 was detected is described hereinabove with reference to Figs. 2-8.

[8843] GAM641 gene, herein designated GAM GENE, and GAM641 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8844] GAM641 gene, herein designated GAM GENE, encodes a GAM641 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM641 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM641 precursor RNA is designated SEQ ID:618, and is provided hereinbelow with reference to the sequence listing part.

[8845] GAM641 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM641 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8846] An enzyme complex designated DICER COMPLEX, dices the GAM641 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM641 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM641 RNA is designated SEQ ID:3218, and is provided hereinbelow with reference to the sequence listing part.

[8847] GAM641 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM641 target RNA, herein designated GAM TARGET RNA. GAM641 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8848] GAM641 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM641 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM641 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM641 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM641 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8849] The complementary binding of GAM641 RNA, herein designated GAM RNA, to target binding sites on GAM641 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM641 target RNA, herein designated GAM TARGET RNA, into GAM641 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8850] It is appreciated that GAM641 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM641 target genes. The mRNA of each one of this plurality of GAM641 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM641 RNA, herein designated GAM RNA, and which when bound by GAM641 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM641 target proteins.

[8851] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM641 gene, herein designated GAM GENE, on one or more GAM641 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8852] It is yet further appreciated that specific functions, and accordingly utilities, of GAM641 correlate with, and may be deduced from, the identity of the target genes which GAM641 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8853] Nucleotide sequences of the GAM641 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM641 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM641 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM641 are further described hereinbelow with reference to Table 1.

[8854] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM641 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8855] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 642 (GAM642) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8856] GAM642 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM642 was detected is described hereinabove with reference to Figs. 2-8.

[8857] GAM642 gene, herein designated GAM GENE, and GAM642 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8858] GAM642 gene, herein designated GAM GENE, encodes a GAM642 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM642 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM642 precursor RNA is designated SEQ ID:619, and is provided hereinbelow with reference to the sequence listing part.

[8859] GAM642 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM642 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8860] An enzyme complex designated DICER COMPLEX, dices the GAM642 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM642 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM642 RNA is designated SEQ ID:3219, and is provided hereinbelow with reference to the sequence listing part.

[8861] GAM642 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM642 target RNA, herein designated GAM TARGET RNA. GAM642 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8862] GAM642 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM642

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM642 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM642 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM642 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8863] The complementary binding of GAM642 RNA, herein designated GAM RNA, to target binding sites on GAM642 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM642 target RNA, herein designated GAM TARGET RNA, into GAM642 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8864] It is appreciated that GAM642 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM642 target genes. The mRNA of each one of this plurality of GAM642 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM642 RNA, herein designated GAM RNA, and which when bound by GAM642 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM642 target proteins.

[8865] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM642 gene, herein designated GAM GENE, on one or more GAM642 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8866] It is yet further appreciated that specific functions, and accordingly utilities, of GAM642 correlate with, and may be deduced from, the identity of the target genes which GAM642 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8867] Nucleotide sequences of the GAM642 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM642 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM642 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM642 are further described hereinbelow with

reference to Table 1.

[8868] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM642 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8869] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 643 (GAM643) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8870] GAM643 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM643 was detected is described hereinabove with reference to Figs. 2-8.

[8871] GAM643 gene, herein designated GAM GENE, and GAM643 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8872] GAM643 gene, herein designated GAM GENE, encodes a GAM643 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM643 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM643 precursor RNA is designated SEQ ID:620, and is provided

hereinbelow with reference to the sequence listing part.

[8873] GAM643 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM643 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8874] An enzyme complex designated DICER COMPLEX, dices the GAM643 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM643 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM643 RNA is designated SEQ ID:3220, and is provided hereinbelow with reference to the sequence listing part.

[8875] GAM643 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM643 target RNA, herein designated GAM TARGET RNA. GAM643 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[8876] GAM643 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM643 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM643 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM643 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM643 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8877] The complementary binding of GAM643 RNA, herein designated GAM RNA, to target binding sites on GAM643 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM643 target RNA, herein designated GAM TARGET RNA, into GAM643 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8878] It is appreciated that GAM643 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM643 target genes. The mRNA of each one of this plurality of GAM643 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM643 RNA, herein designated GAM RNA, and which when bound by GAM643 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM643 target proteins.

[8879] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM643 gene, herein designated GAM GENE, on one or more GAM643 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8880] It is yet further appreciated that specific functions, and accordingly utilities, of GAM643 correlate with, and may be deduced from, the identity of the target genes which GAM643 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8881] Nucleotide sequences of the GAM643 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM643 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM643 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM643 are further described hereinbelow with reference to Table 1.

[8882] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM643 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8883] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 644 (GAM644) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8884] GAM644 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM644 was detected is described hereinabove with reference to Figs. 2-8.

[8885] GAM644 gene, herein designated GAM GENE, and GAM644 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8886] GAM644 gene, herein designated GAM GENE, encodes a GAM644 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM644 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM644 precursor RNA is designated SEQ ID:621, and is provided hereinbelow with reference to the sequence listing part.

[8887] GAM644 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM644 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8888] An enzyme complex designated DICER COMPLEX, dices the GAM644 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM644 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM644 RNA is designated SEQ ID:3221, and is provided hereinbelow with reference to the sequence listing part.

[8889] GAM644 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM644 target RNA, herein designated

GAM TARGET RNA. GAM644 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8890] GAM644 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM644 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM644 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM644 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM644 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8891] The complementary binding of GAM644 RNA, herein designated GAM RNA, to target binding sites on GAM644 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM644 target RNA, herein designated GAM

TARGET RNA, into GAM644 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8892] It is appreciated that GAM644 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM644 target genes. The mRNA of each one of this plurality of GAM644 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM644 RNA, herein designated GAM RNA, and which when bound by GAM644 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM644 target proteins.

[8893] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM644 gene, herein designated GAM GENE, on one or more GAM644 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8894] It is yet further appreciated that specific functions, and accordingly utilities, of GAM644 correlate with, and may be deduced from, the identity of the target

genes which GAM644 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8895] Nucleotide sequences of the GAM644 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM644 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM644 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM644 are further described hereinbelow with reference to Table 1.

[8896] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM644 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8897] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 645 (GAM645) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8898] GAM645 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM645 was detected is described hereinabove with reference to Figs. 2-8.

[8899] GAM645 gene, herein designated GAM GENE, and GAM645 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[8900] GAM645 gene, herein designated GAM GENE, encodes a GAM645 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM645 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM645 precursor RNA is designated SEQ ID:622, and is provided hereinbelow with reference to the sequence listing part.

[8901] GAM645 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM645 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8902] An enzyme complex designated DICER COMPLEX, dices the GAM645 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM645 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM645 RNA is designated SEQ ID:3222, and is provided

hereinbelow with reference to the sequence listing part.

[8903] GAM645 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM645 target RNA, herein designated GAM TARGET RNA. GAM645 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8904] GAM645 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM645 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM645 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM645 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM645 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8905] The complementary binding of GAM645 RNA, herein designated GAM RNA, to target binding sites on GAM645 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM645 target RNA, herein designated GAM TARGET RNA, into GAM645 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8906] It is appreciated that GAM645 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM645 target genes. The mRNA of each one of this plurality of GAM645 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM645 RNA, herein designated GAM RNA, and which when bound by GAM645 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM645 target proteins.

[8907] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM645 gene, herein designated GAM GENE, on one or more GAM645 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8908] It is yet further appreciated that specific functions, and accordingly utilities, of GAM645 correlate with, and may be deduced from, the identity of the target genes which GAM645 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8909] Nucleotide sequences of the GAM645 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM645 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM645 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM645 are further described hereinbelow with reference to Table 1.

[8910] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM645 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8911] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 646 (GAM646) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8912] GAM646 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM646 was detected is

described hereinabove with reference to Figs. 2-8.

[8913] GAM646 gene, herein designated GAM GENE, and GAM646 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8914] GAM646 gene, herein designated GAM GENE, encodes a GAM646 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM646 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM646 precursor RNA is designated SEQ ID:623, and is provided hereinbelow with reference to the sequence listing part.

[8915] GAM646 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM646 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8916] An enzyme complex designated DICER COMPLEX, dices the GAM646 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM646 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM646 RNA is designated SEQ ID:3223, and is provided hereinbelow with reference to the sequence listing part.

[8917] GAM646 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM646 target RNA, herein designated GAM TARGET RNA. GAM646 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8918] GAM646 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM646 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM646 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM646 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM646 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8919] The complementary binding of GAM646 RNA, herein designated GAM RNA, to target binding sites on GAM646 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM646 target RNA, herein designated GAM TARGET RNA, into GAM646 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8920] It is appreciated that GAM646 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM646 target genes. The mRNA of each one of this plurality of GAM646 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM646 RNA, herein designated GAM RNA, and which when bound by GAM646 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM646 target proteins.

[8921] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM646 gene, herein designated GAM GENE, on one or more GAM646 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8922] It is yet further appreciated that specific functions, and accordingly utilities, of GAM646 correlate with, and may be deduced from, the identity of the target genes which GAM646 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8923] Nucleotide sequences of the GAM646 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM646 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM646 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM646 are further described hereinbelow with reference to Table 1.

[8924] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM646 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8925] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 647 (GAM647) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8926] GAM647 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM647 was detected is described hereinabove with reference to Figs. 2-8.

[8927] GAM647 gene, herein designated GAM GENE, and GAM647 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8928] GAM647 gene, herein designated GAM GENE, encodes a GAM647 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM647 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM647 precursor RNA is designated SEQ ID:624, and is provided hereinbelow with reference to the sequence listing part.

[8929] GAM647 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM647 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8930] An enzyme complex designated DICER COMPLEX, dices the GAM647 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM647 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM647 RNA is designated SEQ ID:3224, and is provided hereinbelow with reference to the sequence listing part.

[8931] GAM647 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM647 target RNA, herein designated GAM TARGET RNA. GAM647 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8932] GAM647 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM647 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM647 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM647 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM647 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8933] The complementary binding of GAM647 RNA, herein designated GAM RNA, to target binding sites on GAM647 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM647 target RNA, herein designated GAM TARGET RNA, into GAM647 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8934] It is appreciated that GAM647 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM647 target genes. The mRNA of each one of this plurality of GAM647 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM647 RNA, herein designated GAM RNA, and which when bound by GAM647 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM647 target proteins.

[8935] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM647 gene, herein designated GAM GENE, on one or more GAM647 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8936] It is yet further appreciated that specific functions, and accordingly utilities, of GAM647 correlate with, and may be deduced from, the identity of the target genes which GAM647 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8937] Nucleotide sequences of the GAM647 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM647 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM647 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM647 are further described hereinbelow with reference to Table 1.

[8938] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM647 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8939] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 648 (GAM648) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8940] GAM648 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM648 was detected is described hereinabove with reference to Figs. 2-8.

[8941] GAM648 gene, herein designated GAM GENE, and GAM648 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8942] GAM648 gene, herein designated GAM GENE, encodes a GAM648 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM648 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM648 precursor RNA is designated SEQ ID:625, and is provided hereinbelow with reference to the sequence listing part.

[8943] GAM648 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM648 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8944] An enzyme complex designated DICER COMPLEX, dices the GAM648 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM648 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM648 RNA is designated SEQ ID:3225, and is provided hereinbelow with reference to the sequence listing part.

[8945] GAM648 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM648 target RNA, herein designated GAM TARGET RNA. GAM648 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8946] GAM648 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM648 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM648 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM648 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM648 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8947] The complementary binding of GAM648 RNA, herein designated GAM RNA, to target binding sites on GAM648 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM648 target RNA, herein designated GAM TARGET RNA, into GAM648 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8948] It is appreciated that GAM648 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM648 target genes. The mRNA of each one of this plurality of GAM648 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM648 RNA, herein designated GAM RNA, and which when bound by GAM648 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM648 target proteins.

[8949] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM648 gene, herein designated GAM GENE, on one or more

GAM648 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8950] It is yet further appreciated that specific functions, and accordingly utilities, of GAM648 correlate with, and may be deduced from, the identity of the target genes which GAM648 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8951] Nucleotide sequences of the GAM648 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM648 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM648 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM648 are further described hereinbelow with reference to Table 1.

[8952] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM648 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8953] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 649 (GAM649) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8954] GAM649 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM649 was detected is described hereinabove with reference to Figs. 2-8.

[8955] GAM649 gene, herein designated GAM GENE, and GAM649 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8956] GAM649 gene, herein designated GAM GENE, encodes a GAM649 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM649 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM649 precursor RNA is designated SEQ ID:626, and is provided hereinbelow with reference to the sequence listing part.

[8957] GAM649 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM649 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8958] An enzyme complex designated DICER COMPLEX, dices the GAM649 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM649 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM649 RNA is designated SEQ ID:3226, and is provided hereinbelow with reference to the sequence listing part.

[8959] GAM649 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM649 target RNA, herein designated GAM TARGET RNA. GAM649 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8960] GAM649 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM649 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM649 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM649 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM649 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8961] The complementary binding of GAM649 RNA, herein designated GAM RNA, to target binding sites on GAM649 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM649 target RNA, herein designated GAM TARGET RNA, into GAM649 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8962] It is appreciated that GAM649 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM649 target genes. The mRNA of each one of this plurality of GAM649 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM649 RNA, herein designated GAM RNA, and which when bound by GAM649 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM649 target proteins.

[8963] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM649 gene, herein designated GAM GENE, on one or more GAM649 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8964] It is yet further appreciated that specific functions, and accordingly utilities, of GAM649 correlate with, and may be deduced from, the identity of the target genes which GAM649 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8965] Nucleotide sequences of the GAM649 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM649 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM649 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM649 are further described hereinbelow with reference to Table 1.

[8966] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM649 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8967] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 650 (GAM650) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8968] GAM650 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM650 was detected is described hereinabove with reference to Figs. 2-8.

[8969] GAM650 gene, herein designated GAM GENE, and GAM650 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8970] GAM650 gene, herein designated GAM GENE, encodes a GAM650 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM650 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM650 precursor RNA is designated SEQ ID:627, and is provided hereinbelow with reference to the sequence listing part.

[8971] GAM650 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM650 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8972] An enzyme complex designated DICER COMPLEX, dices the GAM650 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM650 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM650 RNA is designated SEQ ID:3227, and is provided hereinbelow with reference to the sequence listing part.

[8973] GAM650 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM650 target RNA, herein designated GAM TARGET RNA. GAM650 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8974] GAM650 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM650

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM650 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM650 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM650 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8975] The complementary binding of GAM650 RNA, herein designated GAM RNA, to target binding sites on GAM650 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM650 target RNA, herein designated GAM TARGET RNA, into GAM650 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8976] It is appreciated that GAM650 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM650 target genes. The mRNA of each one of this plurality of GAM650 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM650 RNA, herein designated GAM RNA, and which when bound by GAM650 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM650 target proteins.

[8977] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM650 gene, herein designated GAM GENE, on one or more GAM650 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8978] It is yet further appreciated that specific functions, and accordingly utilities, of GAM650 correlate with, and may be deduced from, the identity of the target genes which GAM650 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8979] Nucleotide sequences of the GAM650 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM650 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM650 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM650 are further described hereinbelow with

reference to Table 1.

[8980] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM650 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8981] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 651 (GAM651) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8982] GAM651 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM651 was detected is described hereinabove with reference to Figs. 2-8.

[8983] GAM651 gene, herein designated GAM GENE, and GAM651 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8984] GAM651 gene, herein designated GAM GENE, encodes a GAM651 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM651 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM651 precursor RNA is designated SEQ ID:628, and is provided

hereinbelow with reference to the sequence listing part.

[8985] GAM651 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM651 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8986] An enzyme complex designated DICER COMPLEX, dices the GAM651 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM651 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM651 RNA is designated SEQ ID:3228, and is provided hereinbelow with reference to the sequence listing part.

[8987] GAM651 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM651 target RNA, herein designated GAM TARGET RNA. GAM651 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[8988] GAM651 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM651 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM651 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM651 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM651 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8989] The complementary binding of GAM651 RNA, herein designated GAM RNA, to target binding sites on GAM651 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM651 target RNA, herein designated GAM TARGET RNA, into GAM651 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[8990] It is appreciated that GAM651 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM651 target genes. The mRNA of each one of this plurality of GAM651 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM651 RNA, herein designated GAM RNA, and which when bound by GAM651 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM651 target proteins.

[8991] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM651 gene, herein designated GAM GENE, on one or more GAM651 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8992] It is yet further appreciated that specific functions, and accordingly utilities, of GAM651 correlate with, and may be deduced from, the identity of the target genes which GAM651 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8993] Nucleotide sequences of the GAM651 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM651 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM651 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM651 are further described hereinbelow with reference to Table 1.

[8994] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM651 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[8995] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 652 (GAM652) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[8996] GAM652 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM652 was detected is described hereinabove with reference to Figs. 2-8.

[8997] GAM652 gene, herein designated GAM GENE, and GAM652 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[8998] GAM652 gene, herein designated GAM GENE, encodes a GAM652 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM652 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM652 precursor RNA is designated SEQ ID:629, and is provided hereinbelow with reference to the sequence listing part.

[8999] GAM652 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM652 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9000] An enzyme complex designated DICER COMPLEX, dices the GAM652 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM652 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM652 RNA is designated SEQ ID:3229, and is provided hereinbelow with reference to the sequence listing part.

[9001] GAM652 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM652 target RNA, herein designated

GAM TARGET RNA. GAM652 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9002] GAM652 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM652 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM652 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM652 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM652 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9003] The complementary binding of GAM652 RNA, herein designated GAM RNA, to target binding sites on GAM652 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM652 target RNA, herein designated GAM

TARGET RNA, into GAM652 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9004] It is appreciated that GAM652 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM652 target genes. The mRNA of each one of this plurality of GAM652 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM652 RNA, herein designated GAM RNA, and which when bound by GAM652 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM652 target proteins.

[9005] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM652 gene, herein designated GAM GENE, on one or more GAM652 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9006] It is yet further appreciated that specific functions, and accordingly utilities, of GAM652 correlate with, and may be deduced from, the identity of the target

genes which GAM652 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9007] Nucleotide sequences of the GAM652 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM652 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM652 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM652 are further described hereinbelow with reference to Table 1.

[9008] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM652 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9009] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 653 (GAM653) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9010] GAM653 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM653 was detected is described hereinabove with reference to Figs. 2-8.

[9011] GAM653 gene, herein designated GAM GENE, and GAM653 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[9012] GAM653 gene, herein designated GAM GENE, encodes a GAM653 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM653 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM653 precursor RNA is designated SEQ ID:630, and is provided hereinbelow with reference to the sequence listing part.

[9013] GAM653 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM653 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9014] An enzyme complex designated DICER COMPLEX, dices the GAM653 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM653 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM653 RNA is designated SEQ ID:3230, and is provided

hereinbelow with reference to the sequence listing part.

[9015] GAM653 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM653 target RNA, herein designated GAM TARGET RNA. GAM653 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9016] GAM653 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM653 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM653 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM653 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM653 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9017] The complementary binding of GAM653 RNA, herein designated GAM RNA, to target binding sites on GAM653 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM653 target RNA, herein designated GAM TARGET RNA, into GAM653 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9018] It is appreciated that GAM653 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM653 target genes. The mRNA of each one of this plurality of GAM653 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM653 RNA, herein designated GAM RNA, and which when bound by GAM653 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM653 target proteins.

[9019] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM653 gene, herein designated GAM GENE, on one or more GAM653 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9020] It is yet further appreciated that specific functions, and accordingly utilities, of GAM653 correlate with, and may be deduced from, the identity of the target genes which GAM653 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9021] Nucleotide sequences of the GAM653 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM653 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM653 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM653 are further described hereinbelow with reference to Table 1.

[9022] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM653 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9023] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 654 (GAM654) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9024] GAM654 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM654 was detected is

described hereinabove with reference to Figs. 2-8.

[9025] GAM654 gene, herein designated GAM GENE, and GAM654 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9026] GAM654 gene, herein designated GAM GENE, encodes a GAM654 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM654 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM654 precursor RNA is designated SEQ ID:631, and is provided hereinbelow with reference to the sequence listing part.

[9027] GAM654 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM654 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9028] An enzyme complex designated DICER COMPLEX, dices the GAM654 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM654 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM654 RNA is designated SEQ ID:3231, and is provided hereinbelow with reference to the sequence listing part.

[9029] GAM654 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM654 target RNA, herein designated GAM TARGET RNA. GAM654 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9030] GAM654 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM654 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM654 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM654 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM654 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9031] The complementary binding of GAM654 RNA, herein designated GAM RNA, to target binding sites on GAM654 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM654 target RNA, herein designated GAM TARGET RNA, into GAM654 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9032] It is appreciated that GAM654 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM654 target genes. The mRNA of each one of this plurality of GAM654 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM654 RNA, herein designated GAM RNA, and which when bound by GAM654 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM654 target proteins.

[9033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM654 gene, herein designated GAM GENE, on one or more GAM654 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9034] It is yet further appreciated that specific functions, and accordingly utilities, of GAM654 correlate with, and may be deduced from, the identity of the target genes which GAM654 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9035] Nucleotide sequences of the GAM654 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM654 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM654 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM654 are further described hereinbelow with reference to Table 1.

[9036] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM654 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9037] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 655 (GAM655) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9038] GAM655 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM655 was detected is described hereinabove with reference to Figs. 2-8.

[9039] GAM655 gene, herein designated GAM GENE, and GAM655 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9040] GAM655 gene, herein designated GAM GENE, encodes a GAM655 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM655 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM655 precursor RNA is designated SEQ ID:632, and is provided hereinbelow with reference to the sequence listing part.

[9041] GAM655 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM655 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9042] An enzyme complex designated DICER COMPLEX, dices the GAM655 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM655 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM655 RNA is designated SEQ ID:3232, and is provided hereinbelow with reference to the sequence listing part.

[9043] GAM655 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM655 target RNA, herein designated GAM TARGET RNA. GAM655 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9044] GAM655 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM655 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM655 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM655 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM655 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9045] The complementary binding of GAM655 RNA, herein designated GAM RNA, to target binding sites on GAM655 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM655 target RNA, herein designated GAM TARGET RNA, into GAM655 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9046] It is appreciated that GAM655 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM655 target genes. The mRNA of each one of this plurality of GAM655 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM655 RNA, herein designated GAM RNA, and which when bound by GAM655 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM655 target proteins.

[9047] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM655 gene, herein designated GAM GENE, on one or more GAM655 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9048] It is yet further appreciated that specific functions, and accordingly utilities, of GAM655 correlate with, and may be deduced from, the identity of the target genes which GAM655 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9049] Nucleotide sequences of the GAM655 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM655 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM655 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM655 are further described hereinbelow with reference to Table 1.

[9050] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM655 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9051] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 656 (GAM656) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9052] GAM656 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM656 was detected is described hereinabove with reference to Figs. 2-8.

[9053] GAM656 gene, herein designated GAM GENE, and GAM656 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9054] GAM656 gene, herein designated GAM GENE, encodes a GAM656 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM656 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM656 precursor RNA is designated SEQ ID:633, and is provided hereinbelow with reference to the sequence listing part.

[9055] GAM656 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM656 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9056] An enzyme complex designated DICER COMPLEX, dices the GAM656 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM656 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM656 RNA is designated SEQ ID:3233, and is provided hereinbelow with reference to the sequence listing part.

[9057] GAM656 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM656 target RNA, herein designated GAM TARGET RNA. GAM656 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9058] GAM656 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM656 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM656 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM656 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM656 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9059] The complementary binding of GAM656 RNA, herein designated GAM RNA, to target binding sites on GAM656 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM656 target RNA, herein designated GAM TARGET RNA, into GAM656 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9060] It is appreciated that GAM656 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM656 target genes. The mRNA of each one of this plurality of GAM656 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM656 RNA, herein designated GAM RNA, and which when bound by GAM656 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM656 target proteins.

[9061] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM656 gene, herein designated GAM GENE, on one or more

GAM656 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9062] It is yet further appreciated that specific functions, and accordingly utilities, of GAM656 correlate with, and may be deduced from, the identity of the target genes which GAM656 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9063] Nucleotide sequences of the GAM656 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM656 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM656 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM656 are further described hereinbelow with reference to Table 1.

[9064] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM656 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9065] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 657 (GAM657) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9066] GAM657 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM657 was detected is described hereinabove with reference to Figs. 2-8.

[9067] GAM657 gene, herein designated GAM GENE, and GAM657 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9068] GAM657 gene, herein designated GAM GENE, encodes a GAM657 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM657 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM657 precursor RNA is designated SEQ ID:634, and is provided hereinbelow with reference to the sequence listing part.

[9069] GAM657 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM657 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9070] An enzyme complex designated DICER COMPLEX, dices the GAM657 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM657 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM657 RNA is designated SEQ ID:3234, and is provided hereinbelow with reference to the sequence listing part.

[9071] GAM657 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM657 target RNA, herein designated GAM TARGET RNA. GAM657 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9072] GAM657 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM657 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM657 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM657 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM657 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9073] The complementary binding of GAM657 RNA, herein designated GAM RNA, to target binding sites on GAM657 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM657 target RNA, herein designated GAM TARGET RNA, into GAM657 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9074] It is appreciated that GAM657 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM657 target genes. The mRNA of each one of this plurality of GAM657 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM657 RNA, herein designated GAM RNA, and which when bound by GAM657 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM657 target proteins.

[9075] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM657 gene, herein designated GAM GENE, on one or more GAM657 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9076] It is yet further appreciated that specific functions, and accordingly utilities, of GAM657 correlate with, and may be deduced from, the identity of the target genes which GAM657 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9077] Nucleotide sequences of the GAM657 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM657 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM657 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM657 are further described hereinbelow with reference to Table 1.

[9078] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM657 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9079] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 658 (GAM658) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9080] GAM658 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM658 was detected is described hereinabove with reference to Figs. 2-8.

[9081] GAM658 gene, herein designated GAM GENE, and GAM658 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9082] GAM658 gene, herein designated GAM GENE, encodes a GAM658 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM658 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM658 precursor RNA is designated SEQ ID:635, and is provided hereinbelow with reference to the sequence listing part.

[9083] GAM658 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM658 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9084] An enzyme complex designated DICER COMPLEX, dices the GAM658 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM658 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM658 RNA is designated SEQ ID:3235, and is provided hereinbelow with reference to the sequence listing part.

[9085] GAM658 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM658 target RNA, herein designated GAM TARGET RNA. GAM658 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9086] GAM658 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM658

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM658 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM658 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM658 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9087] The complementary binding of GAM658 RNA, herein designated GAM RNA, to target binding sites on GAM658 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM658 target RNA, herein designated GAM TARGET RNA, into GAM658 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9088] It is appreciated that GAM658 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM658 target genes. The mRNA of each one of this plurality of GAM658 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM658 RNA, herein designated GAM RNA, and which when bound by GAM658 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM658 target proteins.

[9089] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM658 gene, herein designated GAM GENE, on one or more GAM658 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9090] It is yet further appreciated that specific functions, and accordingly utilities, of GAM658 correlate with, and may be deduced from, the identity of the target genes which GAM658 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9091] Nucleotide sequences of the GAM658 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM658 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM658 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM658 are further described hereinbelow with

reference to Table 1.

[9092] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM658 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9093] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 659 (GAM659) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9094] GAM659 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM659 was detected is described hereinabove with reference to Figs. 2-8.

[9095] GAM659 gene, herein designated GAM GENE, and GAM659 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9096] GAM659 gene, herein designated GAM GENE, encodes a GAM659 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM659 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM659 precursor RNA is designated SEQ ID:636, and is provided

hereinbelow with reference to the sequence listing part.

[9097] GAM659 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM659 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9098] An enzyme complex designated DICER COMPLEX, dices the GAM659 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM659 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM659 RNA is designated SEQ ID:3238, and is provided hereinbelow with reference to the sequence listing part.

[9099] GAM659 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM659 target RNA, herein designated GAM TARGET RNA. GAM659 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[9100] GAM659 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM659 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM659 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM659 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM659 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9101] The complementary binding of GAM659 RNA, herein designated GAM RNA, to target binding sites on GAM659 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM659 target RNA, herein designated GAM TARGET RNA, into GAM659 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9102] It is appreciated that GAM659 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM659 target genes. The mRNA of each one of this plurality of GAM659 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM659 RNA, herein designated GAM RNA, and which when bound by GAM659 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM659 target proteins.

[9103] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM659 gene, herein designated GAM GENE, on one or more GAM659 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9104] It is yet further appreciated that specific functions, and accordingly utilities, of GAM659 correlate with, and may be deduced from, the identity of the target genes which GAM659 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9105] Nucleotide sequences of the GAM659 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM659 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM659 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM659 are further described hereinbelow with reference to Table 1.

[9106] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM659 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9107] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 660 (GAM660) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9108] GAM660 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM660 was detected is described hereinabove with reference to Figs. 2-8.

[9109] GAM660 gene, herein designated GAM GENE, and GAM660 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9110] GAM660 gene, herein designated GAM GENE, encodes a GAM660 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM660 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM660 precursor RNA is designated SEQ ID:637, and is provided hereinbelow with reference to the sequence listing part.

[9111] GAM660 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM660 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9112] An enzyme complex designated DICER COMPLEX, dices the GAM660 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM660 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM660 RNA is designated SEQ ID:3237, and is provided hereinbelow with reference to the sequence listing part.

[9113] GAM660 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM660 target RNA, herein designated

GAM TARGET RNA. GAM660 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9114] GAM660 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM660 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM660 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM660 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM660 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9115] The complementary binding of GAM660 RNA, herein designated GAM RNA, to target binding sites on GAM660 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM660 target RNA, herein designated GAM

TARGET RNA, into GAM660 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9116] It is appreciated that GAM660 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM660 target genes. The mRNA of each one of this plurality of GAM660 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM660 RNA, herein designated GAM RNA, and which when bound by GAM660 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM660 target proteins.

[9117] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM660 gene, herein designated GAM GENE, on one or more GAM660 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9118] It is yet further appreciated that specific functions, and accordingly utilities, of GAM660 correlate with, and may be deduced from, the identity of the target

genes which GAM660 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9119] Nucleotide sequences of the GAM660 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM660 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM660 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM660 are further described hereinbelow with reference to Table 1.

[9120] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM660 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9121] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 661 (GAM661) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9122] GAM661 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM661 was detected is described hereinabove with reference to Figs. 2-8.

[9123] GAM661 gene, herein designated GAM GENE, and GAM661 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[9124] GAM661 gene, herein designated GAM GENE, encodes a GAM661 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM661 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM661 precursor RNA is designated SEQ ID:638, and is provided hereinbelow with reference to the sequence listing part.

[9125] GAM661 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM661 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9126] An enzyme complex designated DICER COMPLEX, dices the GAM661 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM661 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM661 RNA is designated SEQ ID:3236, and is provided

hereinbelow with reference to the sequence listing part.

[9127] GAM661 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM661 target RNA, herein designated GAM TARGET RNA. GAM661 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9128] GAM661 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM661 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM661 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM661 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM661 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9129] The complementary binding of GAM661 RNA, herein designated GAM RNA, to target binding sites on GAM661 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM661 target RNA, herein designated GAM TARGET RNA, into GAM661 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9130] It is appreciated that GAM661 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM661 target genes. The mRNA of each one of this plurality of GAM661 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM661 RNA, herein designated GAM RNA, and which when bound by GAM661 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM661 target proteins.

[9131] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM661 gene, herein designated GAM GENE, on one or more GAM661 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9132] It is yet further appreciated that specific functions, and accordingly utilities, of GAM661 correlate with, and may be deduced from, the identity of the target genes which GAM661 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9133] Nucleotide sequences of the GAM661 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM661 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM661 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM661 are further described hereinbelow with reference to Table 1.

[9134] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM661 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9135] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 662 (GAM662) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9136] GAM662 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM662 was detected is

described hereinabove with reference to Figs. 2-8.

[9137] GAM662 gene, herein designated GAM GENE, and GAM662 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9138] GAM662 gene, herein designated GAM GENE, encodes a GAM662 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM662 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM662 precursor RNA is designated SEQ ID:639, and is provided hereinbelow with reference to the sequence listing part.

[9139] GAM662 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM662 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9140] An enzyme complex designated DICER COMPLEX, dices the GAM662 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM662 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM662 RNA is designated SEQ ID:3240, and is provided hereinbelow with reference to the sequence listing part.

[9141] GAM662 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM662 target RNA, herein designated GAM TARGET RNA. GAM662 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9142] GAM662 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM662 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM662 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM662 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM662 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9143] The complementary binding of GAM662 RNA, herein designated GAM RNA, to target binding sites on GAM662 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM662 target RNA, herein designated GAM TARGET RNA, into GAM662 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9144] It is appreciated that GAM662 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM662 target genes. The mRNA of each one of this plurality of GAM662 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM662 RNA, herein designated GAM RNA, and which when bound by GAM662 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM662 target proteins.

[9145] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM662 gene, herein designated GAM GENE, on one or more GAM662 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9146] It is yet further appreciated that specific functions, and accordingly utilities, of GAM662 correlate with, and may be deduced from, the identity of the target genes which GAM662 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9147] Nucleotide sequences of the GAM662 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM662 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM662 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM662 are further described hereinbelow with reference to Table 1.

[9148] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM662 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9149] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 663 (GAM663) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9150] GAM663 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM663 was detected is described hereinabove with reference to Figs. 2-8.

[9151] GAM663 gene, herein designated GAM GENE, and GAM663 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9152] GAM663 gene, herein designated GAM GENE, encodes a GAM663 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM663 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM663 precursor RNA is designated SEQ ID:640, and is provided hereinbelow with reference to the sequence listing part.

[9153] GAM663 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM663 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9154] An enzyme complex designated DICER COMPLEX, dices the GAM663 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM663 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM663 RNA is designated SEQ ID:3239, and is provided hereinbelow with reference to the sequence listing part.

[9155] GAM663 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM663 target RNA, herein designated GAM TARGET RNA. GAM663 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9156] GAM663 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM663 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM663 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM663 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM663 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9157] The complementary binding of GAM663 RNA, herein designated GAM RNA, to target binding sites on GAM663 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM663 target RNA, herein designated GAM TARGET RNA, into GAM663 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9158] It is appreciated that GAM663 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM663 target genes. The mRNA of each one of this plurality of GAM663 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM663 RNA, herein designated GAM RNA, and which when bound by GAM663 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM663 target proteins.

[9159] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM663 gene, herein designated GAM GENE, on one or more GAM663 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9160] It is yet further appreciated that specific functions, and accordingly utilities, of GAM663 correlate with, and may be deduced from, the identity of the target genes which GAM663 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9161] Nucleotide sequences of the GAM663 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM663 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM663 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM663 are further described hereinbelow with reference to Table 1.

[9162] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM663 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9163] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 664 (GAM664) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9164] GAM664 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM664 was detected is described hereinabove with reference to Figs. 2-8.

[9165] GAM664 gene, herein designated GAM GENE, and GAM664 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9166] GAM664 gene, herein designated GAM GENE, encodes a GAM664 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM664 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM664 precursor RNA is designated SEQ ID:641, and is provided hereinbelow with reference to the sequence listing part.

[9167] GAM664 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM664 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9168] An enzyme complex designated DICER COMPLEX, dices the GAM664 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM664 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM664 RNA is designated SEQ ID:3241, and is provided hereinbelow with reference to the sequence listing part.

[9169] GAM664 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM664 target RNA, herein designated GAM TARGET RNA. GAM664 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9170] GAM664 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM664 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM664 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM664 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM664 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9171] The complementary binding of GAM664 RNA, herein designated GAM RNA, to target binding sites on GAM664 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM664 target RNA, herein designated GAM TARGET RNA, into GAM664 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9172] It is appreciated that GAM664 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM664 target genes. The mRNA of each one of this plurality of GAM664 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM664 RNA, herein designated GAM RNA, and which when bound by GAM664 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM664 target proteins.

[9173] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM664 gene, herein designated GAM GENE, on one or more

GAM664 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9174] It is yet further appreciated that specific functions, and accordingly utilities, of GAM664 correlate with, and may be deduced from, the identity of the target genes which GAM664 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9175] Nucleotide sequences of the GAM664 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM664 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM664 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM664 are further described hereinbelow with reference to Table 1.

[9176] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM664 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9177] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 665 (GAM665) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9178] GAM665 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM665 was detected is described hereinabove with reference to Figs. 2-8.

[9179] GAM665 gene, herein designated GAM GENE, and GAM665 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9180] GAM665 gene, herein designated GAM GENE, encodes a GAM665 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM665 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM665 precursor RNA is designated SEQ ID:642, and is provided hereinbelow with reference to the sequence listing part.

[9181] GAM665 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM665 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9182] An enzyme complex designated DICER COMPLEX, dices the GAM665 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM665 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM665 RNA is designated SEQ ID:3243, and is provided hereinbelow with reference to the sequence listing part.

[9183] GAM665 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM665 target RNA, herein designated GAM TARGET RNA. GAM665 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9184] GAM665 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM665 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM665 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM665 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM665 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9185] The complementary binding of GAM665 RNA, herein designated GAM RNA, to target binding sites on GAM665 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM665 target RNA, herein designated GAM TARGET RNA, into GAM665 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9186] It is appreciated that GAM665 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM665 target genes. The mRNA of each one of this plurality of GAM665 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM665 RNA, herein designated GAM RNA, and which when bound by GAM665 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM665 target proteins.

[9187] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM665 gene, herein designated GAM GENE, on one or more GAM665 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9188] It is yet further appreciated that specific functions, and accordingly utilities, of GAM665 correlate with, and may be deduced from, the identity of the target genes which GAM665 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9189] Nucleotide sequences of the GAM665 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM665 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM665 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM665 are further described hereinbelow with reference to Table 1.

[9190] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM665 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9191] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 666 (GAM666) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9192] GAM666 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM666 was detected is described hereinabove with reference to Figs. 2-8.

[9193] GAM666 gene, herein designated GAM GENE, and GAM666 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9194] GAM666 gene, herein designated GAM GENE, encodes a GAM666 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM666 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM666 precursor RNA is designated SEQ ID:643, and is provided hereinbelow with reference to the sequence listing part.

[9195] GAM666 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM666 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9196] An enzyme complex designated DICER COMPLEX, dices the GAM666 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM666 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM666 RNA is designated SEQ ID:3242, and is provided hereinbelow with reference to the sequence listing part.

[9197] GAM666 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM666 target RNA, herein designated GAM TARGET RNA. GAM666 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9198] GAM666 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM666 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM666 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM666 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM666 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9199] The complementary binding of GAM666 RNA, herein designated GAM RNA, to target binding sites on GAM666 target RNA, herein designated GAM

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM666 target RNA, herein designated GAM TARGET RNA, into GAM666 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9200] It is appreciated that GAM666 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM666 target genes. The mRNA of each one of this plurality of GAM666 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM666 RNA, herein designated GAM RNA, and which when bound by GAM666 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM666 target proteins.

[9201] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM666 gene, herein designated GAM GENE, on one or more GAM666 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9202] It is yet further appreciated that specific functions, and accordingly utilities, of GAM666 correlate with, and may be deduced from, the identity of the target genes which GAM666 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9203] Nucleotide sequences of the GAM666 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM666 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM666 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM666 are further described hereinbelow with reference to Table 1.

[9204] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM666 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9205] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 667 (GAM667) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9206] GAM667 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM667 was detected is described hereinabove with reference to Figs. 2-8.

[9207] GAM667 gene, herein designated GAM GENE, and GAM667 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9208] GAM667 gene, herein designated GAM GENE, encodes a GAM667 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM667 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM667 precursor RNA is designated SEQ ID:644, and is provided hereinbelow with reference to the sequence listing part.

[9209] GAM667 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM667 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9210] An enzyme complex designated DICER COMPLEX, dices the GAM667 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM667 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM667 RNA is designated SEQ ID:3245, and is provided hereinbelow with reference to the sequence listing part.

[9211] GAM667 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM667 target RNA, herein designated GAM TARGET RNA. GAM667 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9212] GAM667 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM667 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM667 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM667 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM667 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[9213] The complementary binding of GAM667 RNA, herein designated GAM RNA, to target binding sites on GAM667 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM667 target RNA, herein designated GAM TARGET RNA, into GAM667 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9214] It is appreciated that GAM667 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM667 target genes. The mRNA of each one of this plurality of GAM667 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM667 RNA, herein designated GAM RNA, and which when bound by GAM667 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM667 target proteins.

[9215] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM667 gene, herein designated GAM GENE, on one or more GAM667 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other

genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9216] It is yet further appreciated that specific functions, and accordingly utilities, of GAM667 correlate with, and may be deduced from, the identity of the target genes which GAM667 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9217] Nucleotide sequences of the GAM667 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM667 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM667 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM667 are further described hereinbelow with reference to Table 1.

[9218] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM667 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9219] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 668 (GAM668) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9220] GAM668 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM668 was detected is described hereinabove with reference to Figs. 2-8.

[9221] GAM668 gene, herein designated GAM GENE, and GAM668 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9222] GAM668 gene, herein designated GAM GENE, encodes a GAM668 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM668 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM668 precursor RNA is designated SEQ ID:645, and is provided hereinbelow with reference to the sequence listing part.

[9223] GAM668 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM668 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9224] An enzyme complex designated DICER COMPLEX, dices the GAM668 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM668 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM668 RNA is designated SEQ ID:3244, and is provided hereinbelow with reference to the sequence listing part.

[9225] GAM668 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM668 target RNA, herein designated GAM TARGET RNA. GAM668 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9226] GAM668 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM668 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM668 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM668 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM668 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9227] The complementary binding of GAM668 RNA, herein designated GAM RNA, to target binding sites on GAM668 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM668 target RNA, herein designated GAM TARGET RNA, into GAM668 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9228] It is appreciated that GAM668 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM668 target genes. The mRNA of each one of this plurality of GAM668 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM668 RNA, herein designated GAM RNA, and which when bound by GAM668 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM668 target proteins.

[9229] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM668 gene, herein designated GAM GENE, on one or more GAM668 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9230] It is yet further appreciated that specific functions, and accordingly utilities, of GAM668 correlate with, and may be deduced from, the identity of the target genes which GAM668 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9231] Nucleotide sequences of the GAM668 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM668 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM668 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM668 are further described hereinbelow with reference to Table 1.

[9232] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM668 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9233] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 669 (GAM669) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9234] GAM669 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM669 was detected is described hereinabove with reference to Figs. 2-8.

[9235] GAM669 gene, herein designated GAM GENE, and GAM669 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9236] GAM669 gene, herein designated GAM GENE, encodes a GAM669 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM669 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM669 precursor RNA is designated SEQ ID:646, and is provided hereinbelow with reference to the sequence listing part.

[9237] GAM669 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM669 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9238] An enzyme complex designated DICER COMPLEX, dices the GAM669 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM669 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM669 RNA is designated SEQ ID:3247, and is provided hereinbelow with reference to the sequence listing part.

[9239] GAM669 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM669 target RNA, herein designated GAM TARGET RNA. GAM669 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9240] GAM669 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM669 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM669 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM669 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM669 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9241] The complementary binding of GAM669 RNA, herein designated GAM RNA, to target binding sites on GAM669 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM669 target RNA, herein designated GAM TARGET RNA, into GAM669 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9242] It is appreciated that GAM669 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM669 target genes. The mRNA of each one of this plurality of GAM669 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM669 RNA, herein designated GAM RNA, and which when bound by GAM669 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM669 target proteins.

[9243] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM669 gene, herein designated GAM GENE, on one or more

GAM669 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9244] It is yet further appreciated that specific functions, and accordingly utilities, of GAM669 correlate with, and may be deduced from, the identity of the target genes which GAM669 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9245] Nucleotide sequences of the GAM669 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM669 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM669 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM669 are further described hereinbelow with reference to Table 1.

[9246] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM669 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9247] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 670 (GAM670) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9248] GAM670 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM670 was detected is described hereinabove with reference to Figs. 2-8.

[9249] GAM670 gene, herein designated GAM GENE, and GAM670 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9250] GAM670 gene, herein designated GAM GENE, encodes a GAM670 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM670 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM670 precursor RNA is designated SEQ ID:647, and is provided hereinbelow with reference to the sequence listing part.

[9251] GAM670 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM670 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9252] An enzyme complex designated DICER COMPLEX, dices the GAM670 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM670 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM670 RNA is designated SEQ ID:3246, and is provided hereinbelow with reference to the sequence listing part.

[9253] GAM670 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM670 target RNA, herein designated GAM TARGET RNA. GAM670 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9254] GAM670 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM670 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM670 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM670 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM670 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9255] The complementary binding of GAM670 RNA, herein designated GAM RNA, to target binding sites on GAM670 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM670 target RNA, herein designated GAM TARGET RNA, into GAM670 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9256] It is appreciated that GAM670 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM670 target genes. The mRNA of each one of this plurality of GAM670 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM670 RNA, herein designated GAM RNA, and which when bound by GAM670 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM670 target proteins.

[9257] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM670 gene, herein designated GAM GENE, on one or more GAM670 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9258] It is yet further appreciated that specific functions, and accordingly utilities, of GAM670 correlate with, and may be deduced from, the identity of the target genes which GAM670 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9259] Nucleotide sequences of the GAM670 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM670 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM670 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM670 are further described hereinbelow with reference to Table 1.

[9260] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM670 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9261] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 671 (GAM671) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9262] GAM671 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM671 was detected is described hereinabove with reference to Figs. 2-8.

[9263] GAM671 gene, herein designated GAM GENE, and GAM671 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9264] GAM671 gene, herein designated GAM GENE, encodes a GAM671 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM671 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM671 precursor RNA is designated SEQ ID:648, and is provided hereinbelow with reference to the sequence listing part.

[9265] GAM671 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM671 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9266] An enzyme complex designated DICER COMPLEX, dices the GAM671 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM671 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM671 RNA is designated SEQ ID:3248, and is provided hereinbelow with reference to the sequence listing part.

[9267] GAM671 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM671 target RNA, herein designated GAM TARGET RNA. GAM671 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9268] GAM671 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM671

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM671 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM671 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM671 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9269] The complementary binding of GAM671 RNA, herein designated GAM RNA, to target binding sites on GAM671 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM671 target RNA, herein designated GAM TARGET RNA, into GAM671 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9270] It is appreciated that GAM671 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM671 target genes. The mRNA of each one of this plurality of GAM671 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM671 RNA, herein designated GAM RNA, and which when bound by GAM671 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM671 target proteins.

[9271] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM671 gene, herein designated GAM GENE, on one or more GAM671 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9272] It is yet further appreciated that specific functions, and accordingly utilities, of GAM671 correlate with, and may be deduced from, the identity of the target genes which GAM671 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9273] Nucleotide sequences of the GAM671 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM671 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM671 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM671 are further described hereinbelow with

reference to Table 1.

[9274] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM671 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9275] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 672 (GAM672) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9276] GAM672 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM672 was detected is described hereinabove with reference to Figs. 2-8.

[9277] GAM672 gene, herein designated GAM GENE, and GAM672 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9278] GAM672 gene, herein designated GAM GENE, encodes a GAM672 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM672 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM672 precursor RNA is designated SEQ ID:649, and is provided

hereinbelow with reference to the sequence listing part.

[9279] GAM672 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM672 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9280] An enzyme complex designated DICER COMPLEX, dices the GAM672 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM672 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM672 RNA is designated SEQ ID:3249, and is provided hereinbelow with reference to the sequence listing part.

[9281] GAM672 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM672 target RNA, herein designated GAM TARGET RNA. GAM672 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[9282] GAM672 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM672 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM672 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM672 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM672 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9283] The complementary binding of GAM672 RNA, herein designated GAM RNA, to target binding sites on GAM672 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM672 target RNA, herein designated GAM TARGET RNA, into GAM672 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9284] It is appreciated that GAM672 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM672 target genes. The mRNA of each one of this plurality of GAM672 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM672 RNA, herein designated GAM RNA, and which when bound by GAM672 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM672 target proteins.

[9285] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM672 gene, herein designated GAM GENE, on one or more GAM672 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9286] It is yet further appreciated that specific functions, and accordingly utilities, of GAM672 correlate with, and may be deduced from, the identity of the target genes which GAM672 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9287] Nucleotide sequences of the GAM672 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM672 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM672 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM672 are further described hereinbelow with reference to Table 1.

[9288] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM672 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9289] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 673 (GAM673) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9290] GAM673 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM673 was detected is described hereinabove with reference to Figs. 2-8.

[9291] GAM673 gene, herein designated GAM GENE, and GAM673 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9292] GAM673 gene, herein designated GAM GENE, encodes a GAM673 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM673 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM673 precursor RNA is designated SEQ ID:650, and is provided hereinbelow with reference to the sequence listing part.

[9293] GAM673 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM673 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9294] An enzyme complex designated DICER COMPLEX, dices the GAM673 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM673 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM673 RNA is designated SEQ ID:3251, and is provided hereinbelow with reference to the sequence listing part.

[9295] GAM673 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM673 target RNA, herein designated

GAM TARGET RNA. GAM673 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9296] GAM673 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM673 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM673 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM673 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM673 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9297] The complementary binding of GAM673 RNA, herein designated GAM RNA, to target binding sites on GAM673 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM673 target RNA, herein designated GAM

TARGET RNA, into GAM673 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9298] It is appreciated that GAM673 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM673 target genes. The mRNA of each one of this plurality of GAM673 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM673 RNA, herein designated GAM RNA, and which when bound by GAM673 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM673 target proteins.

[9299] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM673 gene, herein designated GAM GENE, on one or more GAM673 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9300] It is yet further appreciated that specific functions, and accordingly utilities, of GAM673 correlate with, and may be deduced from, the identity of the target

genes which GAM673 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9301] Nucleotide sequences of the GAM673 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM673 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM673 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM673 are further described hereinbelow with reference to Table 1.

[9302] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM673 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9303] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 674 (GAM674) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9304] GAM674 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM674 was detected is described hereinabove with reference to Figs. 2-8.

[9305] GAM674 gene, herein designated GAM GENE, and GAM674 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[9306] GAM674 gene, herein designated GAM GENE, encodes a GAM674 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM674 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM674 precursor RNA is designated SEQ ID:651, and is provided hereinbelow with reference to the sequence listing part.

[9307] GAM674 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9308] An enzyme complex designated DICER COMPLEX, dices the GAM674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM674 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM674 RNA is designated SEQ ID:3250, and is provided

hereinbelow with reference to the sequence listing part.

[9309] GAM674 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM674 target RNA, herein designated GAM TARGET RNA. GAM674 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9310] GAM674 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM674 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM674 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM674 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM674 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9311] The complementary binding of GAM674 RNA, herein designated GAM RNA, to target binding sites on GAM674 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM674 target RNA, herein designated GAM TARGET RNA, into GAM674 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9312] It is appreciated that GAM674 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM674 target genes. The mRNA of each one of this plurality of GAM674 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM674 RNA, herein designated GAM RNA, and which when bound by GAM674 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM674 target proteins.

[9313] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM674 gene, herein designated GAM GENE, on one or more GAM674 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9314] It is yet further appreciated that specific functions, and accordingly utilities, of GAM674 correlate with, and may be deduced from, the identity of the target genes which GAM674 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9315] Nucleotide sequences of the GAM674 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM674 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM674 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM674 are further described hereinbelow with reference to Table 1.

[9316] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM674 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9317] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 675 (GAM675) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9318] GAM675 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM675 was detected is

described hereinabove with reference to Figs. 2-8.

[9319] GAM675 gene, herein designated GAM GENE, and GAM675 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9320] GAM675 gene, herein designated GAM GENE, encodes a GAM675 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM675 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM675 precursor RNA is designated SEQ ID:652, and is provided hereinbelow with reference to the sequence listing part.

[9321] GAM675 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM675 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9322] An enzyme complex designated DICER COMPLEX, dices the GAM675 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM675 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM675 RNA is designated SEQ ID:3252, and is provided hereinbelow with reference to the sequence listing part.

[9323] GAM675 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM675 target RNA, herein designated GAM TARGET RNA. GAM675 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9324] GAM675 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM675 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM675 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM675 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM675 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9325] The complementary binding of GAM675 RNA, herein designated GAM RNA, to target binding sites on GAM675 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM675 target RNA, herein designated GAM TARGET RNA, into GAM675 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9326] It is appreciated that GAM675 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM675 target genes. The mRNA of each one of this plurality of GAM675 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM675 RNA, herein designated GAM RNA, and which when bound by GAM675 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM675 target proteins.

[9327] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM675 gene, herein designated GAM GENE, on one or more GAM675 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9328] It is yet further appreciated that specific functions, and accordingly utilities, of GAM675 correlate with, and may be deduced from, the identity of the target genes which GAM675 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9329] Nucleotide sequences of the GAM675 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM675 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM675 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM675 are further described hereinbelow with reference to Table 1.

[9330] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM675 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9331] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 676 (GAM676) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9332] GAM676 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM676 was detected is described hereinabove with reference to Figs. 2-8.

[9333] GAM676 gene, herein designated GAM GENE, and GAM676 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9334] GAM676 gene, herein designated GAM GENE, encodes a GAM676 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM676 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM676 precursor RNA is designated SEQ ID:653, and is provided hereinbelow with reference to the sequence listing part.

[9335] GAM676 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM676 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9336] An enzyme complex designated DICER COMPLEX, dices the GAM676 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM676 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM676 RNA is designated SEQ ID:3253, and is provided hereinbelow with reference to the sequence listing part.

[9337] GAM676 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM676 target RNA, herein designated GAM TARGET RNA. GAM676 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9338] GAM676 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM676 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM676 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM676 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM676 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9339] The complementary binding of GAM676 RNA, herein designated GAM RNA, to target binding sites on GAM676 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM676 target RNA, herein designated GAM TARGET RNA, into GAM676 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9340] It is appreciated that GAM676 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM676 target genes. The mRNA of each one of this plurality of GAM676 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM676 RNA, herein designated GAM RNA, and which when bound by GAM676 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM676 target proteins.

[9341] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM676 gene, herein designated GAM GENE, on one or more GAM676 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9342] It is yet further appreciated that specific functions, and accordingly utilities, of GAM676 correlate with, and may be deduced from, the identity of the target genes which GAM676 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9343] Nucleotide sequences of the GAM676 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM676 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM676 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM676 are further described hereinbelow with reference to Table 1.

[9344] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM676 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9345] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 677 (GAM677) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9346] GAM677 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM677 was detected is described hereinabove with reference to Figs. 2-8.

[9347] GAM677 gene, herein designated GAM GENE, and GAM677 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9348] GAM677 gene, herein designated GAM GENE, encodes a GAM677 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM677 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM677 precursor RNA is designated SEQ ID:654, and is provided hereinbelow with reference to the sequence listing part.

[9349] GAM677 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM677 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9350] An enzyme complex designated DICER COMPLEX, dices the GAM677 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM677 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM677 RNA is designated SEQ ID:3254, and is provided hereinbelow with reference to the sequence listing part.

[9351] GAM677 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM677 target RNA, herein designated GAM TARGET RNA. GAM677 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9352] GAM677 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM677 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM677 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM677 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM677 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9353] The complementary binding of GAM677 RNA, herein designated GAM RNA, to target binding sites on GAM677 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM677 target RNA, herein designated GAM TARGET RNA, into GAM677 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9354] It is appreciated that GAM677 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM677 target genes. The mRNA of each one of this plurality of GAM677 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM677 RNA, herein designated GAM RNA, and which when bound by GAM677 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM677 target proteins.

[9355] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM677 gene, herein designated GAM GENE, on one or more

GAM677 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9356] It is yet further appreciated that specific functions, and accordingly utilities, of GAM677 correlate with, and may be deduced from, the identity of the target genes which GAM677 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9357] Nucleotide sequences of the GAM677 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM677 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM677 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM677 are further described hereinbelow with reference to Table 1.

[9358] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM677 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9359] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 678 (GAM678) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9360] GAM678 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM678 was detected is described hereinabove with reference to Figs. 2-8.

[9361] GAM678 gene, herein designated GAM GENE, and GAM678 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9362] GAM678 gene, herein designated GAM GENE, encodes a GAM678 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM678 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM678 precursor RNA is designated SEQ ID:655, and is provided hereinbelow with reference to the sequence listing part.

[9363] GAM678 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM678 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9364] An enzyme complex designated DICER COMPLEX, dices the GAM678 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM678 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM678 RNA is designated SEQ ID:3255, and is provided hereinbelow with reference to the sequence listing part.

[9365] GAM678 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM678 target RNA, herein designated GAM TARGET RNA. GAM678 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9366] GAM678 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM678 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM678 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM678 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM678 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9367] The complementary binding of GAM678 RNA, herein designated GAM RNA, to target binding sites on GAM678 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM678 target RNA, herein designated GAM TARGET RNA, into GAM678 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9368] It is appreciated that GAM678 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM678 target genes. The mRNA of each one of this plurality of GAM678 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM678 RNA, herein designated GAM RNA, and which when bound by GAM678 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM678 target proteins.

[9369] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM678 gene, herein designated GAM GENE, on one or more GAM678 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9370] It is yet further appreciated that specific functions, and accordingly utilities, of GAM678 correlate with, and may be deduced from, the identity of the target genes which GAM678 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9371] Nucleotide sequences of the GAM678 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM678 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM678 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM678 are further described hereinbelow with reference to Table 1.

[9372] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM678 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9373] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 679 (GAM679) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9374] GAM679 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM679 was detected is described hereinabove with reference to Figs. 2-8.

[9375] GAM679 gene, herein designated GAM GENE, and GAM679 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9376] GAM679 gene, herein designated GAM GENE, encodes a GAM679 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM679 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM679 precursor RNA is designated SEQ ID:656, and is provided hereinbelow with reference to the sequence listing part.

[9377] GAM679 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM679 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9378] An enzyme complex designated DICER COMPLEX, dices the GAM679 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM679 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM679 RNA is designated SEQ ID:3258, and is provided hereinbelow with reference to the sequence listing part.

[9379] GAM679 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM679 target RNA, herein designated GAM TARGET RNA. GAM679 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9380] GAM679 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM679

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM679 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM679 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM679 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9381] The complementary binding of GAM679 RNA, herein designated GAM RNA, to target binding sites on GAM679 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM679 target RNA, herein designated GAM TARGET RNA, into GAM679 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9382] It is appreciated that GAM679 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM679 target genes. The mRNA of each one of this plurality of GAM679 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM679 RNA, herein designated GAM RNA, and which when bound by GAM679 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM679 target proteins.

[9383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM679 gene, herein designated GAM GENE, on one or more GAM679 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9384] It is yet further appreciated that specific functions, and accordingly utilities, of GAM679 correlate with, and may be deduced from, the identity of the target genes which GAM679 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9385] Nucleotide sequences of the GAM679 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM679 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM679 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM679 are further described hereinbelow with

reference to Table 1.

[9386] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM679 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9387] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 680 (GAM680) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9388] GAM680 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM680 was detected is described hereinabove with reference to Figs. 2-8.

[9389] GAM680 gene, herein designated GAM GENE, and GAM680 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9390] GAM680 gene, herein designated GAM GENE, encodes a GAM680 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM680 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM680 precursor RNA is designated SEQ ID:657, and is provided

hereinbelow with reference to the sequence listing part.

[9391] GAM680 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM680 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9392] An enzyme complex designated DICER COMPLEX, dices the GAM680 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM680 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM680 RNA is designated SEQ ID:3256, and is provided hereinbelow with reference to the sequence listing part.

[9393] GAM680 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM680 target RNA, herein designated GAM TARGET RNA. GAM680 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[9394] GAM680 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM680 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM680 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM680 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM680 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9395] The complementary binding of GAM680 RNA, herein designated GAM RNA, to target binding sites on GAM680 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM680 target RNA, herein designated GAM TARGET RNA, into GAM680 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9396] It is appreciated that GAM680 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM680 target genes. The mRNA of each one of this plurality of GAM680 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM680 RNA, herein designated GAM RNA, and which when bound by GAM680 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM680 target proteins.

[9397] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM680 gene, herein designated GAM GENE, on one or more GAM680 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9398] It is yet further appreciated that specific functions, and accordingly utilities, of GAM680 correlate with, and may be deduced from, the identity of the target genes which GAM680 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9399] Nucleotide sequences of the GAM680 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM680 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM680 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM680 are further described hereinbelow with reference to Table 1.

[9400] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM680 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9401] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 681 (GAM681) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9402] GAM681 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM681 was detected is described hereinabove with reference to Figs. 2-8.

[9403] GAM681 gene, herein designated GAM GENE, and GAM681 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9404] GAM681 gene, herein designated GAM GENE, encodes a GAM681 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM681 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM681 precursor RNA is designated SEQ ID:658, and is provided hereinbelow with reference to the sequence listing part.

[9405] GAM681 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM681 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9406] An enzyme complex designated DICER COMPLEX, dices the GAM681 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM681 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM681 RNA is designated SEQ ID:3257, and is provided hereinbelow with reference to the sequence listing part.

[9407] GAM681 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM681 target RNA, herein designated

GAM TARGET RNA. GAM681 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9408] GAM681 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM681 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM681 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM681 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM681 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9409] The complementary binding of GAM681 RNA, herein designated GAM RNA, to target binding sites on GAM681 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM681 target RNA, herein designated GAM

TARGET RNA, into GAM681 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9410] It is appreciated that GAM681 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM681 target genes. The mRNA of each one of this plurality of GAM681 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM681 RNA, herein designated GAM RNA, and which when bound by GAM681 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM681 target proteins.

[9411] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM681 gene, herein designated GAM GENE, on one or more GAM681 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9412] It is yet further appreciated that specific functions, and accordingly utilities, of GAM681 correlate with, and may be deduced from, the identity of the target

genes which GAM681 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9413] Nucleotide sequences of the GAM681 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM681 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM681 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM681 are further described hereinbelow with reference to Table 1.

[9414] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM681 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9415] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 682 (GAM682) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9416] GAM682 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM682 was detected is described hereinabove with reference to Figs. 2-8.

[9417] GAM682 gene, herein designated GAM GENE, and GAM682 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[9418] GAM682 gene, herein designated GAM GENE, encodes a GAM682 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM682 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM682 precursor RNA is designated SEQ ID:659, and is provided hereinbelow with reference to the sequence listing part.

[9419] GAM682 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM682 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9420] An enzyme complex designated DICER COMPLEX, dices the GAM682 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM682 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM682 RNA is designated SEQ ID:3259, and is provided

hereinbelow with reference to the sequence listing part.

[9421] GAM682 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM682 target RNA, herein designated GAM TARGET RNA. GAM682 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9422] GAM682 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM682 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM682 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM682 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM682 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9423] The complementary binding of GAM682 RNA, herein designated GAM RNA, to target binding sites on GAM682 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM682 target RNA, herein designated GAM TARGET RNA, into GAM682 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9424] It is appreciated that GAM682 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM682 target genes. The mRNA of each one of this plurality of GAM682 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM682 RNA, herein designated GAM RNA, and which when bound by GAM682 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM682 target proteins.

[9425] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM682 gene, herein designated GAM GENE, on one or more GAM682 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9426] It is yet further appreciated that specific functions, and accordingly utilities, of GAM682 correlate with, and may be deduced from, the identity of the target genes which GAM682 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9427] Nucleotide sequences of the GAM682 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM682 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM682 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM682 are further described hereinbelow with reference to Table 1.

[9428] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM682 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9429] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 683 (GAM683) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9430] GAM683 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM683 was detected is

described hereinabove with reference to Figs. 2-8.

[9431] GAM683 gene, herein designated GAM GENE, and GAM683 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9432] GAM683 gene, herein designated GAM GENE, encodes a GAM683 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM683 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM683 precursor RNA is designated SEQ ID:660, and is provided hereinbelow with reference to the sequence listing part.

[9433] GAM683 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM683 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9434] An enzyme complex designated DICER COMPLEX, dices the GAM683 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM683 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM683 RNA is designated SEQ ID:3260, and is provided hereinbelow with reference to the sequence listing part.

[9435] GAM683 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM683 target RNA, herein designated GAM TARGET RNA. GAM683 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9436] GAM683 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM683 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM683 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM683 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM683 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9437] The complementary binding of GAM683 RNA, herein designated GAM RNA, to target binding sites on GAM683 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM683 target RNA, herein designated GAM TARGET RNA, into GAM683 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9438] It is appreciated that GAM683 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM683 target genes. The mRNA of each one of this plurality of GAM683 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM683 RNA, herein designated GAM RNA, and which when bound by GAM683 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM683 target proteins.

[9439] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM683 gene, herein designated GAM GENE, on one or more GAM683 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9440] It is yet further appreciated that specific functions, and accordingly utilities, of GAM683 correlate with, and may be deduced from, the identity of the target genes which GAM683 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9441] Nucleotide sequences of the GAM683 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM683 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM683 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM683 are further described hereinbelow with reference to Table 1.

[9442] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM683 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9443] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 684 (GAM684) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9444] GAM684 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM684 was detected is described hereinabove with reference to Figs. 2-8.

[9445] GAM684 gene, herein designated GAM GENE, and GAM684 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9446] GAM684 gene, herein designated GAM GENE, encodes a GAM684 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM684 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM684 precursor RNA is designated SEQ ID:661, and is provided hereinbelow with reference to the sequence listing part.

[9447] GAM684 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM684 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9448] An enzyme complex designated DICER COMPLEX, dices the GAM684 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM684 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM684 RNA is designated SEQ ID:3261, and is provided hereinbelow with reference to the sequence listing part.

[9449] GAM684 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM684 target RNA, herein designated GAM TARGET RNA. GAM684 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9450] GAM684 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM684 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM684 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM684 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM684 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9451] The complementary binding of GAM684 RNA, herein designated GAM RNA, to target binding sites on GAM684 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM684 target RNA, herein designated GAM TARGET RNA, into GAM684 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9452] It is appreciated that GAM684 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM684 target genes. The mRNA of each one of this plurality of GAM684 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM684 RNA, herein designated GAM RNA, and which when bound by GAM684 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM684 target proteins.

[9453] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM684 gene, herein designated GAM GENE, on one or more GAM684 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9454] It is yet further appreciated that specific functions, and accordingly utilities, of GAM684 correlate with, and may be deduced from, the identity of the target genes which GAM684 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9455] Nucleotide sequences of the GAM684 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM684 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM684 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM684 are further described hereinbelow with reference to Table 1.

[9456] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM684 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9457] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 685 (GAM685) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9458] GAM685 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM685 was detected is described hereinabove with reference to Figs. 2-8.

[9459] GAM685 gene, herein designated GAM GENE, and GAM685 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9460] GAM685 gene, herein designated GAM GENE, encodes a GAM685 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM685 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM685 precursor RNA is designated SEQ ID:662, and is provided hereinbelow with reference to the sequence listing part.

[9461] GAM685 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM685 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9462] An enzyme complex designated DICER COMPLEX, dices the GAM685 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM685 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM685 RNA is designated SEQ ID:3262, and is provided hereinbelow with reference to the sequence listing part.

[9463] GAM685 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM685 target RNA, herein designated GAM TARGET RNA. GAM685 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9464] GAM685 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM685 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM685 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM685 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM685 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9465] The complementary binding of GAM685 RNA, herein designated GAM RNA, to target binding sites on GAM685 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM685 target RNA, herein designated GAM TARGET RNA, into GAM685 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9466] It is appreciated that GAM685 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM685 target genes. The mRNA of each one of this plurality of GAM685 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM685 RNA, herein designated GAM RNA, and which when bound by GAM685 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM685 target proteins.

[9467] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM685 gene, herein designated GAM GENE, on one or more

GAM685 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9468] It is yet further appreciated that specific functions, and accordingly utilities, of GAM685 correlate with, and may be deduced from, the identity of the target genes which GAM685 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9469] Nucleotide sequences of the GAM685 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM685 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM685 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM685 are further described hereinbelow with reference to Table 1.

[9470] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM685 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9471] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 686 (GAM686) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9472] GAM686 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM686 was detected is described hereinabove with reference to Figs. 2-8.

[9473] GAM686 gene, herein designated GAM GENE, and GAM686 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9474] GAM686 gene, herein designated GAM GENE, encodes a GAM686 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM686 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM686 precursor RNA is designated SEQ ID:663, and is provided hereinbelow with reference to the sequence listing part.

[9475] GAM686 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM686 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9476] An enzyme complex designated DICER COMPLEX, dices the GAM686 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM686 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM686 RNA is designated SEQ ID:3263, and is provided hereinbelow with reference to the sequence listing part.

[9477] GAM686 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM686 target RNA, herein designated GAM TARGET RNA. GAM686 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9478] GAM686 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM686 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM686 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM686 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM686 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9479] The complementary binding of GAM686 RNA, herein designated GAM RNA, to target binding sites on GAM686 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM686 target RNA, herein designated GAM TARGET RNA, into GAM686 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9480] It is appreciated that GAM686 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM686 target genes. The mRNA of each one of this plurality of GAM686 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM686 RNA, herein designated GAM RNA, and which when bound by GAM686 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM686 target proteins.

[9481] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM686 gene, herein designated GAM GENE, on one or more GAM686 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9482] It is yet further appreciated that specific functions, and accordingly utilities, of GAM686 correlate with, and may be deduced from, the identity of the target genes which GAM686 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9483] Nucleotide sequences of the GAM686 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM686 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM686 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM686 are further described hereinbelow with reference to Table 1.

[9484] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM686 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9485] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 687 (GAM687) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9486] GAM687 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM687 was detected is described hereinabove with reference to Figs. 2-8.

[9487] GAM687 gene, herein designated GAM GENE, and GAM687 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9488] GAM687 gene, herein designated GAM GENE, encodes a GAM687 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM687 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM687 precursor RNA is designated SEQ ID:664, and is provided hereinbelow with reference to the sequence listing part.

[9489] GAM687 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM687 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9490] An enzyme complex designated DICER COMPLEX, dices the GAM687 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM687 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM687 RNA is designated SEQ ID:3264, and is provided hereinbelow with reference to the sequence listing part.

[9491] GAM687 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM687 target RNA, herein designated GAM TARGET RNA. GAM687 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9492] GAM687 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM687

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM687 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM687 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM687 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9493] The complementary binding of GAM687 RNA, herein designated GAM RNA, to target binding sites on GAM687 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM687 target RNA, herein designated GAM TARGET RNA, into GAM687 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9494] It is appreciated that GAM687 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM687 target genes. The mRNA of each one of this plurality of GAM687 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM687 RNA, herein designated GAM RNA, and which when bound by GAM687 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM687 target proteins.

[9495] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM687 gene, herein designated GAM GENE, on one or more GAM687 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9496] It is yet further appreciated that specific functions, and accordingly utilities, of GAM687 correlate with, and may be deduced from, the identity of the target genes which GAM687 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9497] Nucleotide sequences of the GAM687 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM687 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM687 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM687 are further described hereinbelow with

reference to Table 1.

[9498] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM687 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9499] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 688 (GAM688) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9500] GAM688 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM688 was detected is described hereinabove with reference to Figs. 2-8.

[9501] GAM688 gene, herein designated GAM GENE, and GAM688 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9502] GAM688 gene, herein designated GAM GENE, encodes a GAM688 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM688 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM688 precursor RNA is designated SEQ ID:665, and is provided

hereinbelow with reference to the sequence listing part.

[9503] GAM688 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM688 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9504] An enzyme complex designated DICER COMPLEX, dices the GAM688 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM688 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM688 RNA is designated SEQ ID:3265, and is provided hereinbelow with reference to the sequence listing part.

[9505] GAM688 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM688 target RNA, herein designated GAM TARGET RNA. GAM688 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[9506] GAM688 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM688 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM688 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM688 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM688 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9507] The complementary binding of GAM688 RNA, herein designated GAM RNA, to target binding sites on GAM688 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM688 target RNA, herein designated GAM TARGET RNA, into GAM688 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9508] It is appreciated that GAM688 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM688 target genes. The mRNA of each one of this plurality of GAM688 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM688 RNA, herein designated GAM RNA, and which when bound by GAM688 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM688 target proteins.

[9509] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM688 gene, herein designated GAM GENE, on one or more GAM688 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9510] It is yet further appreciated that specific functions, and accordingly utilities, of GAM688 correlate with, and may be deduced from, the identity of the target genes which GAM688 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9511] Nucleotide sequences of the GAM688 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM688 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM688 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM688 are further described hereinbelow with reference to Table 1.

[9512] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM688 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9513] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 689 (GAM689) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9514] GAM689 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM689 was detected is described hereinabove with reference to Figs. 2-8.

[9515] GAM689 gene, herein designated GAM GENE, and GAM689 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9516] GAM689 gene, herein designated GAM GENE, encodes a GAM689 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM689 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM689 precursor RNA is designated SEQ ID:666, and is provided hereinbelow with reference to the sequence listing part.

[9517] GAM689 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM689 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9518] An enzyme complex designated DICER COMPLEX, dices the GAM689 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM689 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM689 RNA is designated SEQ ID:3267, and is provided hereinbelow with reference to the sequence listing part.

[9519] GAM689 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM689 target RNA, herein designated

GAM TARGET RNA. GAM689 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9520] GAM689 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM689 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM689 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM689 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM689 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9521] The complementary binding of GAM689 RNA, herein designated GAM RNA, to target binding sites on GAM689 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM689 target RNA, herein designated GAM

TARGET RNA, into GAM689 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9522] It is appreciated that GAM689 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM689 target genes. The mRNA of each one of this plurality of GAM689 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM689 RNA, herein designated GAM RNA, and which when bound by GAM689 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM689 target proteins.

[9523] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM689 gene, herein designated GAM GENE, on one or more GAM689 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9524] It is yet further appreciated that specific functions, and accordingly utilities, of GAM689 correlate with, and may be deduced from, the identity of the target

genes which GAM689 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9525] Nucleotide sequences of the GAM689 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM689 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM689 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM689 are further described hereinbelow with reference to Table 1.

[9526] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM689 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9527] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 690 (GAM690) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9528] GAM690 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM690 was detected is described hereinabove with reference to Figs. 2-8.

[9529] GAM690 gene, herein designated GAM GENE, and GAM690 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[9530] GAM690 gene, herein designated GAM GENE, encodes a GAM690 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM690 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM690 precursor RNA is designated SEQ ID:667, and is provided hereinbelow with reference to the sequence listing part.

[9531] GAM690 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM690 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9532] An enzyme complex designated DICER COMPLEX, dices the GAM690 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM690 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM690 RNA is designated SEQ ID:3266, and is provided

hereinbelow with reference to the sequence listing part.

[9533] GAM690 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM690 target RNA, herein designated GAM TARGET RNA. GAM690 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9534] GAM690 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM690 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM690 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM690 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM690 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9535] The complementary binding of GAM690 RNA, herein designated GAM RNA, to target binding sites on GAM690 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM690 target RNA, herein designated GAM TARGET RNA, into GAM690 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9536] It is appreciated that GAM690 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM690 target genes. The mRNA of each one of this plurality of GAM690 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM690 RNA, herein designated GAM RNA, and which when bound by GAM690 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM690 target proteins.

[9537] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM690 gene, herein designated GAM GENE, on one or more GAM690 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9538] It is yet further appreciated that specific functions, and accordingly utilities, of GAM690 correlate with, and may be deduced from, the identity of the target genes which GAM690 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9539] Nucleotide sequences of the GAM690 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM690 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM690 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM690 are further described hereinbelow with reference to Table 1.

[9540] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM690 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9541] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 691 (GAM691) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9542] GAM691 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM691 was detected is

described hereinabove with reference to Figs. 2-8.

[9543] GAM691 gene, herein designated GAM GENE, and GAM691 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9544] GAM691 gene, herein designated GAM GENE, encodes a GAM691 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM691 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM691 precursor RNA is designated SEQ ID:668, and is provided hereinbelow with reference to the sequence listing part.

[9545] GAM691 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM691 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9546] An enzyme complex designated DICER COMPLEX, dices the GAM691 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM691 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM691 RNA is designated SEQ ID:3268, and is provided hereinbelow with reference to the sequence listing part.

[9547] GAM691 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM691 target RNA, herein designated GAM TARGET RNA. GAM691 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9548] GAM691 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM691 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM691 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM691 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM691 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9549] The complementary binding of GAM691 RNA, herein designated GAM RNA, to target binding sites on GAM691 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM691 target RNA, herein designated GAM TARGET RNA, into GAM691 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9550] It is appreciated that GAM691 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM691 target genes. The mRNA of each one of this plurality of GAM691 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM691 RNA, herein designated GAM RNA, and which when bound by GAM691 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM691 target proteins.

[9551] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM691 gene, herein designated GAM GENE, on one or more GAM691 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9552] It is yet further appreciated that specific functions, and accordingly utilities, of GAM691 correlate with, and may be deduced from, the identity of the target genes which GAM691 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9553] Nucleotide sequences of the GAM691 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM691 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM691 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM691 are further described hereinbelow with reference to Table 1.

[9554] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM691 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9555] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 692 (GAM692) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9556] GAM692 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM692 was detected is described hereinabove with reference to Figs. 2-8.

[9557] GAM692 gene, herein designated GAM GENE, and GAM692 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9558] GAM692 gene, herein designated GAM GENE, encodes a GAM692 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM692 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM692 precursor RNA is designated SEQ ID:669, and is provided hereinbelow with reference to the sequence listing part.

[9559] GAM692 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM692 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9560] An enzyme complex designated DICER COMPLEX, dices the GAM692 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM692 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM692 RNA is designated SEQ ID:3269, and is provided hereinbelow with reference to the sequence listing part.

[9561] GAM692 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM692 target RNA, herein designated GAM TARGET RNA. GAM692 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9562] GAM692 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM692 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM692 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM692 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM692 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9563] The complementary binding of GAM692 RNA, herein designated GAM RNA, to target binding sites on GAM692 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM692 target RNA, herein designated GAM TARGET RNA, into GAM692 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9564] It is appreciated that GAM692 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM692 target genes. The mRNA of each one of this plurality of GAM692 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM692 RNA, herein designated GAM RNA, and which when bound by GAM692 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM692 target proteins.

[9565] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM692 gene, herein designated GAM GENE, on one or more GAM692 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9566] It is yet further appreciated that specific functions, and accordingly utilities, of GAM692 correlate with, and may be deduced from, the identity of the target genes which GAM692 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9567] Nucleotide sequences of the GAM692 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM692 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM692 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM692 are further described hereinbelow with reference to Table 1.

[9568] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM692 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9569] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 693 (GAM693) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9570] GAM693 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM693 was detected is described hereinabove with reference to Figs. 2-8.

[9571] GAM693 gene, herein designated GAM GENE, and GAM693 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9572] GAM693 gene, herein designated GAM GENE, encodes a GAM693 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM693 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM693 precursor RNA is designated SEQ ID:670, and is provided hereinbelow with reference to the sequence listing part.

[9573] GAM693 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM693 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9574] An enzyme complex designated DICER COMPLEX, dices the GAM693 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM693 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM693 RNA is designated SEQ ID:3270, and is provided hereinbelow with reference to the sequence listing part.

[9575] GAM693 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM693 target RNA, herein designated GAM TARGET RNA. GAM693 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9576] GAM693 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM693 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM693 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM693 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM693 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9577] The complementary binding of GAM693 RNA, herein designated GAM RNA, to target binding sites on GAM693 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM693 target RNA, herein designated GAM TARGET RNA, into GAM693 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9578] It is appreciated that GAM693 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM693 target genes. The mRNA of each one of this plurality of GAM693 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM693 RNA, herein designated GAM RNA, and which when bound by GAM693 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM693 target proteins.

[9579] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM693 gene, herein designated GAM GENE, on one or more

GAM693 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9580] It is yet further appreciated that specific functions, and accordingly utilities, of GAM693 correlate with, and may be deduced from, the identity of the target genes which GAM693 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9581] Nucleotide sequences of the GAM693 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM693 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM693 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM693 are further described hereinbelow with reference to Table 1.

[9582] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM693 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9583] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 694 (GAM694) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9584] GAM694 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM694 was detected is described hereinabove with reference to Figs. 2-8.

[9585] GAM694 gene, herein designated GAM GENE, and GAM694 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9586] GAM694 gene, herein designated GAM GENE, encodes a GAM694 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM694 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM694 precursor RNA is designated SEQ ID:671, and is provided hereinbelow with reference to the sequence listing part.

[9587] GAM694 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM694 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9588] An enzyme complex designated DICER COMPLEX, dices the GAM694 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM694 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM694 RNA is designated SEQ ID:3272, and is provided hereinbelow with reference to the sequence listing part.

[9589] GAM694 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM694 target RNA, herein designated GAM TARGET RNA. GAM694 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9590] GAM694 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM694 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM694 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM694 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM694 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9591] The complementary binding of GAM694 RNA, herein designated GAM RNA, to target binding sites on GAM694 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM694 target RNA, herein designated GAM TARGET RNA, into GAM694 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9592] It is appreciated that GAM694 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM694 target genes. The mRNA of each one of this plurality of GAM694 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM694 RNA, herein designated GAM RNA, and which when bound by GAM694 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM694 target proteins.

[9593] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM694 gene, herein designated GAM GENE, on one or more GAM694 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9594] It is yet further appreciated that specific functions, and accordingly utilities, of GAM694 correlate with, and may be deduced from, the identity of the target genes which GAM694 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9595] Nucleotide sequences of the GAM694 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM694 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM694 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM694 are further described hereinbelow with reference to Table 1.

[9596] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM694 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9597] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 695 (GAM695) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9598] GAM695 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM695 was detected is described hereinabove with reference to Figs. 2-8.

[9599] GAM695 gene, herein designated GAM GENE, and GAM695 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9600] GAM695 gene, herein designated GAM GENE, encodes a GAM695 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM695 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM695 precursor RNA is designated SEQ ID:672, and is provided hereinbelow with reference to the sequence listing part.

[9601] GAM695 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM695 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9602] An enzyme complex designated DICER COMPLEX, dices the GAM695 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM695 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM695 RNA is designated SEQ ID:3273, and is provided hereinbelow with reference to the sequence listing part.

[9603] GAM695 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM695 target RNA, herein designated GAM TARGET RNA. GAM695 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9604] GAM695 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM695

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM695 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM695 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM695 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9605] The complementary binding of GAM695 RNA, herein designated GAM RNA, to target binding sites on GAM695 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM695 target RNA, herein designated GAM TARGET RNA, into GAM695 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9606] It is appreciated that GAM695 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM695 target genes. The mRNA of each one of this plurality of GAM695 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM695 RNA, herein designated GAM RNA, and which when bound by GAM695 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM695 target proteins.

[9607] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM695 gene, herein designated GAM GENE, on one or more GAM695 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9608] It is yet further appreciated that specific functions, and accordingly utilities, of GAM695 correlate with, and may be deduced from, the identity of the target genes which GAM695 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9609] Nucleotide sequences of the GAM695 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM695 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM695 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM695 are further described hereinbelow with

reference to Table 1.

[9610] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM695 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9611] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 696 (GAM696) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9612] GAM696 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM696 was detected is described hereinabove with reference to Figs. 2-8.

[9613] GAM696 gene, herein designated GAM GENE, and GAM696 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9614] GAM696 gene, herein designated GAM GENE, encodes a GAM696 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM696 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM696 precursor RNA is designated SEQ ID:673, and is provided

hereinbelow with reference to the sequence listing part.

[9615] GAM696 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM696 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9616] An enzyme complex designated DICER COMPLEX, dices the GAM696 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM696 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM696 RNA is designated SEQ ID:3274, and is provided hereinbelow with reference to the sequence listing part.

[9617] GAM696 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM696 target RNA, herein designated GAM TARGET RNA. GAM696 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[9618] GAM696 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM696 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM696 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM696 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM696 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9619] The complementary binding of GAM696 RNA, herein designated GAM RNA, to target binding sites on GAM696 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM696 target RNA, herein designated GAM TARGET RNA, into GAM696 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9620] It is appreciated that GAM696 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM696 target genes. The mRNA of each one of this plurality of GAM696 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM696 RNA, herein designated GAM RNA, and which when bound by GAM696 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM696 target proteins.

[9621] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM696 gene, herein designated GAM GENE, on one or more GAM696 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9622] It is yet further appreciated that specific functions, and accordingly utilities, of GAM696 correlate with, and may be deduced from, the identity of the target genes which GAM696 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9623] Nucleotide sequences of the GAM696 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM696 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM696 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM696 are further described hereinbelow with reference to Table 1.

[9624] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM696 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9625] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 697 (GAM697) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9626] GAM697 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM697 was detected is described hereinabove with reference to Figs. 2-8.

[9627] GAM697 gene, herein designated GAM GENE, and GAM697 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9628] GAM697 gene, herein designated GAM GENE, encodes a GAM697 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM697 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM697 precursor RNA is designated SEQ ID:674, and is provided hereinbelow with reference to the sequence listing part.

[9629] GAM697 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM697 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9630] An enzyme complex designated DICER COMPLEX, dices the GAM697 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM697 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM697 RNA is designated SEQ ID:3271, and is provided hereinbelow with reference to the sequence listing part.

[9631] GAM697 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM697 target RNA, herein designated

GAM TARGET RNA. GAM697 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9632] GAM697 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM697 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM697 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM697 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM697 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9633] The complementary binding of GAM697 RNA, herein designated GAM RNA, to target binding sites on GAM697 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM697 target RNA, herein designated GAM

TARGET RNA, into GAM697 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9634] It is appreciated that GAM697 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM697 target genes. The mRNA of each one of this plurality of GAM697 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM697 RNA, herein designated GAM RNA, and which when bound by GAM697 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM697 target proteins.

[9635] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM697 gene, herein designated GAM GENE, on one or more GAM697 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9636] It is yet further appreciated that specific functions, and accordingly utilities, of GAM697 correlate with, and may be deduced from, the identity of the target

genes which GAM697 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9637] Nucleotide sequences of the GAM697 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM697 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM697 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM697 are further described hereinbelow with reference to Table 1.

[9638] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM697 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9639] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 698 (GAM698) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9640] GAM698 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM698 was detected is described hereinabove with reference to Figs. 2-8.

[9641] GAM698 gene, herein designated GAM GENE, and GAM698 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[9642] GAM698 gene, herein designated GAM GENE, encodes a GAM698 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM698 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM698 precursor RNA is designated SEQ ID:675, and is provided hereinbelow with reference to the sequence listing part.

[9643] GAM698 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM698 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9644] An enzyme complex designated DICER COMPLEX, dices the GAM698 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM698 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM698 RNA is designated SEQ ID:3275, and is provided

hereinbelow with reference to the sequence listing part.

[9645] GAM698 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM698 target RNA, herein designated GAM TARGET RNA. GAM698 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9646] GAM698 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM698 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM698 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM698 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM698 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9647] The complementary binding of GAM698 RNA, herein designated GAM RNA, to target binding sites on GAM698 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM698 target RNA, herein designated GAM TARGET RNA, into GAM698 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9648] It is appreciated that GAM698 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM698 target genes. The mRNA of each one of this plurality of GAM698 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM698 RNA, herein designated GAM RNA, and which when bound by GAM698 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM698 target proteins.

[9649] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM698 gene, herein designated GAM GENE, on one or more GAM698 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9650] It is yet further appreciated that specific functions, and accordingly utilities, of GAM698 correlate with, and may be deduced from, the identity of the target genes which GAM698 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9651] Nucleotide sequences of the GAM698 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM698 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM698 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM698 are further described hereinbelow with reference to Table 1.

[9652] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM698 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9653] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 699 (GAM699) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9654] GAM699 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM699 was detected is

described hereinabove with reference to Figs. 2-8.

[9655] GAM699 gene, herein designated GAM GENE, and GAM699 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9656] GAM699 gene, herein designated GAM GENE, encodes a GAM699 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM699 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM699 precursor RNA is designated SEQ ID:676, and is provided hereinbelow with reference to the sequence listing part.

[9657] GAM699 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM699 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9658] An enzyme complex designated DICER COMPLEX, dices the GAM699 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM699 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM699 RNA is designated SEQ ID:3276, and is provided hereinbelow with reference to the sequence listing part.

[9659] GAM699 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM699 target RNA, herein designated GAM TARGET RNA. GAM699 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9660] GAM699 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM699 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM699 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM699 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM699 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9661] The complementary binding of GAM699 RNA, herein designated GAM RNA, to target binding sites on GAM699 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM699 target RNA, herein designated GAM TARGET RNA, into GAM699 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9662] It is appreciated that GAM699 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM699 target genes. The mRNA of each one of this plurality of GAM699 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM699 RNA, herein designated GAM RNA, and which when bound by GAM699 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM699 target proteins.

[9663] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM699 gene, herein designated GAM GENE, on one or more GAM699 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9664] It is yet further appreciated that specific functions, and accordingly utilities, of GAM699 correlate with, and may be deduced from, the identity of the target genes which GAM699 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9665] Nucleotide sequences of the GAM699 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM699 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM699 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM699 are further described hereinbelow with reference to Table 1.

[9666] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM699 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9667] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 700 (GAM700) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9668] GAM700 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM700 was detected is described hereinabove with reference to Figs. 2-8.

[9669] GAM700 gene, herein designated GAM GENE, and GAM700 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9670] GAM700 gene, herein designated GAM GENE, encodes a GAM700 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM700 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM700 precursor RNA is designated SEQ ID:677, and is provided hereinbelow with reference to the sequence listing part.

[9671] GAM700 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM700 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9672] An enzyme complex designated DICER COMPLEX, dices the GAM700 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM700 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM700 RNA is designated SEQ ID:3277, and is provided hereinbelow with reference to the sequence listing part.

[9673] GAM700 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM700 target RNA, herein designated GAM TARGET RNA. GAM700 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9674] GAM700 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM700 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM700 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM700 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM700 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9675] The complementary binding of GAM700 RNA, herein designated GAM RNA, to target binding sites on GAM700 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM700 target RNA, herein designated GAM TARGET RNA, into GAM700 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9676] It is appreciated that GAM700 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM700 target genes. The mRNA of each one of this plurality of GAM700 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM700 RNA, herein designated GAM RNA, and which when bound by GAM700 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM700 target proteins.

[9677] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM700 gene, herein designated GAM GENE, on one or more GAM700 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9678] It is yet further appreciated that specific functions, and accordingly utilities, of GAM700 correlate with, and may be deduced from, the identity of the target genes which GAM700 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9679] Nucleotide sequences of the GAM700 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM700 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM700 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM700 are further described hereinbelow with reference to Table 1.

[9680] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM700 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9681] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 701 (GAM701) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9682] GAM701 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM701 was detected is described hereinabove with reference to Figs. 2-8.

[9683] GAM701 gene, herein designated GAM GENE, and GAM701 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9684] GAM701 gene, herein designated GAM GENE, encodes a GAM701 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM701 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM701 precursor RNA is designated SEQ ID:678, and is provided hereinbelow with reference to the sequence listing part.

[9685] GAM701 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM701 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9686] An enzyme complex designated DICER COMPLEX, dices the GAM701 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM701 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM701 RNA is designated SEQ ID:3278, and is provided hereinbelow with reference to the sequence listing part.

[9687] GAM701 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM701 target RNA, herein designated GAM TARGET RNA. GAM701 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9688] GAM701 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM701 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM701 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM701 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM701 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9689] The complementary binding of GAM701 RNA, herein designated GAM RNA, to target binding sites on GAM701 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM701 target RNA, herein designated GAM TARGET RNA, into GAM701 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9690] It is appreciated that GAM701 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM701 target genes. The mRNA of each one of this plurality of GAM701 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM701 RNA, herein designated GAM RNA, and which when bound by GAM701 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM701 target proteins.

[9691] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM701 gene, herein designated GAM GENE, on one or more

GAM701 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9692] It is yet further appreciated that specific functions, and accordingly utilities, of GAM701 correlate with, and may be deduced from, the identity of the target genes which GAM701 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9693] Nucleotide sequences of the GAM701 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM701 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM701 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM701 are further described hereinbelow with reference to Table 1.

[9694] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM701 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9695] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 702 (GAM702) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9696] GAM702 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM702 was detected is described hereinabove with reference to Figs. 2-8.

[9697] GAM702 gene, herein designated GAM GENE, and GAM702 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9698] GAM702 gene, herein designated GAM GENE, encodes a GAM702 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM702 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM702 precursor RNA is designated SEQ ID:679, and is provided hereinbelow with reference to the sequence listing part.

[9699] GAM702 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM702 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9700] An enzyme complex designated DICER COMPLEX, dices the GAM702 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM702 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM702 RNA is designated SEQ ID:3279, and is provided hereinbelow with reference to the sequence listing part.

[9701] GAM702 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM702 target RNA, herein designated GAM TARGET RNA. GAM702 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9702] GAM702 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM702 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM702 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM702 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM702 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9703] The complementary binding of GAM702 RNA, herein designated GAM RNA, to target binding sites on GAM702 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM702 target RNA, herein designated GAM TARGET RNA, into GAM702 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9704] It is appreciated that GAM702 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM702 target genes. The mRNA of each one of this plurality of GAM702 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM702 RNA, herein designated GAM RNA, and which when bound by GAM702 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM702 target proteins.

[9705] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM702 gene, herein designated GAM GENE, on one or more GAM702 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9706] It is yet further appreciated that specific functions, and accordingly utilities, of GAM702 correlate with, and may be deduced from, the identity of the target genes which GAM702 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9707] Nucleotide sequences of the GAM702 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM702 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM702 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM702 are further described hereinbelow with reference to Table 1.

[9708] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM702 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9709] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 703 (GAM703) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9710] GAM703 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM703 was detected is described hereinabove with reference to Figs. 2-8.

[9711] GAM703 gene, herein designated GAM GENE, and GAM703 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9712] GAM703 gene, herein designated GAM GENE, encodes a GAM703 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM703 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM703 precursor RNA is designated SEQ ID:680, and is provided hereinbelow with reference to the sequence listing part.

[9713] GAM703 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM703 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9714] An enzyme complex designated DICER COMPLEX, dices the GAM703 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM703 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM703 RNA is designated SEQ ID:3280, and is provided hereinbelow with reference to the sequence listing part.

[9715] GAM703 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM703 target RNA, herein designated GAM TARGET RNA. GAM703 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9716] GAM703 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM703

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM703 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM703 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM703 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9717] The complementary binding of GAM703 RNA, herein designated GAM RNA, to target binding sites on GAM703 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM703 target RNA, herein designated GAM TARGET RNA, into GAM703 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9718] It is appreciated that GAM703 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM703 target genes. The mRNA of each one of this plurality of GAM703 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM703 RNA, herein designated GAM RNA, and which when bound by GAM703 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM703 target proteins.

[9719] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM703 gene, herein designated GAM GENE, on one or more GAM703 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9720] It is yet further appreciated that specific functions, and accordingly utilities, of GAM703 correlate with, and may be deduced from, the identity of the target genes which GAM703 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9721] Nucleotide sequences of the GAM703 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM703 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM703 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM703 are further described hereinbelow with

reference to Table 1.

[9722] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM703 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9723] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 704 (GAM704) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9724] GAM704 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM704 was detected is described hereinabove with reference to Figs. 2-8.

[9725] GAM704 gene, herein designated GAM GENE, and GAM704 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9726] GAM704 gene, herein designated GAM GENE, encodes a GAM704 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM704 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM704 precursor RNA is designated SEQ ID:681, and is provided

hereinbelow with reference to the sequence listing part.

[9727] GAM704 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM704 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9728] An enzyme complex designated DICER COMPLEX, dices the GAM704 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM704 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM704 RNA is designated SEQ ID:3281, and is provided hereinbelow with reference to the sequence listing part.

[9729] GAM704 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM704 target RNA, herein designated GAM TARGET RNA. GAM704 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[9730] GAM704 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM704 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM704 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM704 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM704 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9731] The complementary binding of GAM704 RNA, herein designated GAM RNA, to target binding sites on GAM704 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM704 target RNA, herein designated GAM TARGET RNA, into GAM704 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9732] It is appreciated that GAM704 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM704 target genes. The mRNA of each one of this plurality of GAM704 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM704 RNA, herein designated GAM RNA, and which when bound by GAM704 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM704 target proteins.

[9733] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM704 gene, herein designated GAM GENE, on one or more GAM704 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9734] It is yet further appreciated that specific functions, and accordingly utilities, of GAM704 correlate with, and may be deduced from, the identity of the target genes which GAM704 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9735] Nucleotide sequences of the GAM704 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM704 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM704 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM704 are further described hereinbelow with reference to Table 1.

[9736] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM704 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9737] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 705 (GAM705) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9738] GAM705 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM705 was detected is described hereinabove with reference to Figs. 2-8.

[9739] GAM705 gene, herein designated GAM GENE, and GAM705 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9740] GAM705 gene, herein designated GAM GENE, encodes a GAM705 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM705 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM705 precursor RNA is designated SEQ ID:682, and is provided hereinbelow with reference to the sequence listing part.

[9741] GAM705 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM705 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9742] An enzyme complex designated DICER COMPLEX, dices the GAM705 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM705 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM705 RNA is designated SEQ ID:3282, and is provided hereinbelow with reference to the sequence listing part.

[9743] GAM705 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM705 target RNA, herein designated

GAM TARGET RNA. GAM705 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9744] GAM705 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM705 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM705 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM705 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM705 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9745] The complementary binding of GAM705 RNA, herein designated GAM RNA, to target binding sites on GAM705 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM705 target RNA, herein designated GAM

TARGET RNA, into GAM705 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9746] It is appreciated that GAM705 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM705 target genes. The mRNA of each one of this plurality of GAM705 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM705 RNA, herein designated GAM RNA, and which when bound by GAM705 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM705 target proteins.

[9747] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM705 gene, herein designated GAM GENE, on one or more GAM705 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9748] It is yet further appreciated that specific functions, and accordingly utilities, of GAM705 correlate with, and may be deduced from, the identity of the target

genes which GAM705 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9749] Nucleotide sequences of the GAM705 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM705 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM705 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM705 are further described hereinbelow with reference to Table 1.

[9750] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM705 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9751] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 706 (GAM706) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9752] GAM706 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM706 was detected is described hereinabove with reference to Figs. 2-8.

[9753] GAM706 gene, herein designated GAM GENE, and GAM706 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[9754] GAM706 gene, herein designated GAM GENE, encodes a GAM706 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM706 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM706 precursor RNA is designated SEQ ID:683, and is provided hereinbelow with reference to the sequence listing part.

[9755] GAM706 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM706 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9756] An enzyme complex designated DICER COMPLEX, dices the GAM706 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM706 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM706 RNA is designated SEQ ID:3283, and is provided

hereinbelow with reference to the sequence listing part.

[9757] GAM706 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM706 target RNA, herein designated GAM TARGET RNA. GAM706 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9758] GAM706 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM706 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM706 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM706 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM706 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9759] The complementary binding of GAM706 RNA, herein designated GAM RNA, to target binding sites on GAM706 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM706 target RNA, herein designated GAM TARGET RNA, into GAM706 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9760] It is appreciated that GAM706 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM706 target genes. The mRNA of each one of this plurality of GAM706 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM706 RNA, herein designated GAM RNA, and which when bound by GAM706 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM706 target proteins.

[9761] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM706 gene, herein designated GAM GENE, on one or more GAM706 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9762] It is yet further appreciated that specific functions, and accordingly utilities, of GAM706 correlate with, and may be deduced from, the identity of the target genes which GAM706 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9763] Nucleotide sequences of the GAM706 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM706 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM706 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM706 are further described hereinbelow with reference to Table 1.

[9764] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM706 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9765] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 707 (GAM707) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9766] GAM707 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM707 was detected is

described hereinabove with reference to Figs. 2-8.

[9767] GAM707 gene, herein designated GAM GENE, and GAM707 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9768] GAM707 gene, herein designated GAM GENE, encodes a GAM707 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM707 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM707 precursor RNA is designated SEQ ID:684, and is provided hereinbelow with reference to the sequence listing part.

[9769] GAM707 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9770] An enzyme complex designated DICER COMPLEX, dices the GAM707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM707 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM707 RNA is designated SEQ ID:3284, and is provided hereinbelow with reference to the sequence listing part.

[9771] GAM707 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM707 target RNA, herein designated GAM TARGET RNA. GAM707 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9772] GAM707 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM707 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM707 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM707 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM707 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9773] The complementary binding of GAM707 RNA, herein designated GAM RNA, to target binding sites on GAM707 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM707 target RNA, herein designated GAM TARGET RNA, into GAM707 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9774] It is appreciated that GAM707 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM707 target genes. The mRNA of each one of this plurality of GAM707 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM707 RNA, herein designated GAM RNA, and which when bound by GAM707 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM707 target proteins.

[9775] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM707 gene, herein designated GAM GENE, on one or more GAM707 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9776] It is yet further appreciated that specific functions, and accordingly utilities, of GAM707 correlate with, and may be deduced from, the identity of the target genes which GAM707 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9777] Nucleotide sequences of the GAM707 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM707 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM707 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM707 are further described hereinbelow with reference to Table 1.

[9778] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM707 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9779] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 708 (GAM708) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9780] GAM708 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM708 was detected is described hereinabove with reference to Figs. 2-8.

[9781] GAM708 gene, herein designated GAM GENE, and GAM708 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9782] GAM708 gene, herein designated GAM GENE, encodes a GAM708 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM708 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM708 precursor RNA is designated SEQ ID:685, and is provided hereinbelow with reference to the sequence listing part.

[9783] GAM708 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM708 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9784] An enzyme complex designated DICER COMPLEX, dices the GAM708 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM708 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM708 RNA is designated SEQ ID:3285, and is provided hereinbelow with reference to the sequence listing part.

[9785] GAM708 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM708 target RNA, herein designated GAM TARGET RNA. GAM708 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9786] GAM708 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM708 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM708 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM708 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM708 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9787] The complementary binding of GAM708 RNA, herein designated GAM RNA, to target binding sites on GAM708 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM708 target RNA, herein designated GAM TARGET RNA, into GAM708 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9788] It is appreciated that GAM708 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM708 target genes. The mRNA of each one of this plurality of GAM708 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM708 RNA, herein designated GAM RNA, and which when bound by GAM708 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM708 target proteins.

[9789] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM708 gene, herein designated GAM GENE, on one or more GAM708 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9790] It is yet further appreciated that specific functions, and accordingly utilities, of GAM708 correlate with, and may be deduced from, the identity of the target genes which GAM708 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9791] Nucleotide sequences of the GAM708 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM708 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM708 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM708 are further described hereinbelow with reference to Table 1.

[9792] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM708 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9793] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 709 (GAM709) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9794] GAM709 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM709 was detected is described hereinabove with reference to Figs. 2-8.

[9795] GAM709 gene, herein designated GAM GENE, and GAM709 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9796] GAM709 gene, herein designated GAM GENE, encodes a GAM709 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM709 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM709 precursor RNA is designated SEQ ID:686, and is provided hereinbelow with reference to the sequence listing part.

[9797] GAM709 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM709 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9798] An enzyme complex designated DICER COMPLEX, dices the GAM709 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM709 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM709 RNA is designated SEQ ID:3286, and is provided hereinbelow with reference to the sequence listing part.

[9799] GAM709 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM709 target RNA, herein designated GAM TARGET RNA. GAM709 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9800] GAM709 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM709 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM709 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM709 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM709 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9801] The complementary binding of GAM709 RNA, herein designated GAM RNA, to target binding sites on GAM709 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM709 target RNA, herein designated GAM TARGET RNA, into GAM709 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9802] It is appreciated that GAM709 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM709 target genes. The mRNA of each one of this plurality of GAM709 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM709 RNA, herein designated GAM RNA, and which when bound by GAM709 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM709 target proteins.

[9803] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM709 gene, herein designated GAM GENE, on one or more

GAM709 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9804] It is yet further appreciated that specific functions, and accordingly utilities, of GAM709 correlate with, and may be deduced from, the identity of the target genes which GAM709 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9805] Nucleotide sequences of the GAM709 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM709 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM709 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM709 are further described hereinbelow with reference to Table 1.

[9806] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM709 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9807] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 710 (GAM710) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9808] GAM710 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM710 was detected is described hereinabove with reference to Figs. 2-8.

[9809] GAM710 gene, herein designated GAM GENE, and GAM710 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9810] GAM710 gene, herein designated GAM GENE, encodes a GAM710 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM710 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM710 precursor RNA is designated SEQ ID:687, and is provided hereinbelow with reference to the sequence listing part.

[9811] GAM710 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM710 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9812] An enzyme complex designated DICER COMPLEX, dices the GAM710 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM710 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM710 RNA is designated SEQ ID:3287, and is provided hereinbelow with reference to the sequence listing part.

[9813] GAM710 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM710 target RNA, herein designated GAM TARGET RNA. GAM710 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9814] GAM710 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM710 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM710 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM710 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM710 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9815] The complementary binding of GAM710 RNA, herein designated GAM RNA, to target binding sites on GAM710 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM710 target RNA, herein designated GAM TARGET RNA, into GAM710 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9816] It is appreciated that GAM710 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM710 target genes. The mRNA of each one of this plurality of GAM710 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM710 RNA, herein designated GAM RNA, and which when bound by GAM710 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM710 target proteins.

[9817] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM710 gene, herein designated GAM GENE, on one or more GAM710 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9818] It is yet further appreciated that specific functions, and accordingly utilities, of GAM710 correlate with, and may be deduced from, the identity of the target genes which GAM710 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9819] Nucleotide sequences of the GAM710 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM710 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM710 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM710 are further described hereinbelow with reference to Table 1.

[9820] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM710 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9821] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 711 (GAM711) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9822] GAM711 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM711 was detected is described hereinabove with reference to Figs. 2-8.

[9823] GAM711 gene, herein designated GAM GENE, and GAM711 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9824] GAM711 gene, herein designated GAM GENE, encodes a GAM711 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM711 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM711 precursor RNA is designated SEQ ID:688, and is provided hereinbelow with reference to the sequence listing part.

[9825] GAM711 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM711 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9826] An enzyme complex designated DICER COMPLEX, dices the GAM711 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM711 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM711 RNA is designated SEQ ID:3288, and is provided hereinbelow with reference to the sequence listing part.

[9827] GAM711 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM711 target RNA, herein designated GAM TARGET RNA. GAM711 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9828] GAM711 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM711

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM711 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM711 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM711 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9829] The complementary binding of GAM711 RNA, herein designated GAM RNA, to target binding sites on GAM711 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM711 target RNA, herein designated GAM TARGET RNA, into GAM711 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9830] It is appreciated that GAM711 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM711 target genes. The mRNA of each one of this plurality of GAM711 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM711 RNA, herein designated GAM RNA, and which when bound by GAM711 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM711 target proteins.

[9831] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM711 gene, herein designated GAM GENE, on one or more GAM711 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9832] It is yet further appreciated that specific functions, and accordingly utilities, of GAM711 correlate with, and may be deduced from, the identity of the target genes which GAM711 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9833] Nucleotide sequences of the GAM711 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM711 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM711 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM711 are further described hereinbelow with

reference to Table 1.

[9834] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM711 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9835] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 712 (GAM712) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9836] GAM712 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM712 was detected is described hereinabove with reference to Figs. 2-8.

[9837] GAM712 gene, herein designated GAM GENE, and GAM712 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9838] GAM712 gene, herein designated GAM GENE, encodes a GAM712 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM712 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM712 precursor RNA is designated SEQ ID:689, and is provided

hereinbelow with reference to the sequence listing part.

[9839] GAM712 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM712 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9840] An enzyme complex designated DICER COMPLEX, dices the GAM712 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM712 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM712 RNA is designated SEQ ID:3289, and is provided hereinbelow with reference to the sequence listing part.

[9841] GAM712 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM712 target RNA, herein designated GAM TARGET RNA. GAM712 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[9842] GAM712 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM712 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM712 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM712 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM712 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9843] The complementary binding of GAM712 RNA, herein designated GAM RNA, to target binding sites on GAM712 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM712 target RNA, herein designated GAM TARGET RNA, into GAM712 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9844] It is appreciated that GAM712 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM712 target genes. The mRNA of each one of this plurality of GAM712 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM712 RNA, herein designated GAM RNA, and which when bound by GAM712 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM712 target proteins.

[9845] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM712 gene, herein designated GAM GENE, on one or more GAM712 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9846] It is yet further appreciated that specific functions, and accordingly utilities, of GAM712 correlate with, and may be deduced from, the identity of the target genes which GAM712 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9847] Nucleotide sequences of the GAM712 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM712 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM712 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM712 are further described hereinbelow with reference to Table 1.

[9848] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM712 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9849] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 713 (GAM713) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9850] GAM713 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM713 was detected is described hereinabove with reference to Figs. 2-8.

[9851] GAM713 gene, herein designated GAM GENE, and GAM713 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9852] GAM713 gene, herein designated GAM GENE, encodes a GAM713 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM713 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM713 precursor RNA is designated SEQ ID:690, and is provided hereinbelow with reference to the sequence listing part.

[9853] GAM713 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM713 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9854] An enzyme complex designated DICER COMPLEX, dices the GAM713 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM713 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM713 RNA is designated SEQ ID:3290, and is provided hereinbelow with reference to the sequence listing part.

[9855] GAM713 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM713 target RNA, herein designated

GAM TARGET RNA. GAM713 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9856] GAM713 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM713 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM713 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM713 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM713 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9857] The complementary binding of GAM713 RNA, herein designated GAM RNA, to target binding sites on GAM713 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM713 target RNA, herein designated GAM

TARGET RNA, into GAM713 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9858] It is appreciated that GAM713 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM713 target genes. The mRNA of each one of this plurality of GAM713 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM713 RNA, herein designated GAM RNA, and which when bound by GAM713 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM713 target proteins.

[9859] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM713 gene, herein designated GAM GENE, on one or more GAM713 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9860] It is yet further appreciated that specific functions, and accordingly utilities, of GAM713 correlate with, and may be deduced from, the identity of the target

genes which GAM713 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9861] Nucleotide sequences of the GAM713 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM713 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM713 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM713 are further described hereinbelow with reference to Table 1.

[9862] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM713 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9863] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 714 (GAM714) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9864] GAM714 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM714 was detected is described hereinabove with reference to Figs. 2-8.

[9865] GAM714 gene, herein designated GAM GENE, and GAM714 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[9866] GAM714 gene, herein designated GAM GENE, encodes a GAM714 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM714 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM714 precursor RNA is designated SEQ ID:691, and is provided hereinbelow with reference to the sequence listing part.

[9867] GAM714 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM714 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9868] An enzyme complex designated DICER COMPLEX, dices the GAM714 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM714 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM714 RNA is designated SEQ ID:3291, and is provided

hereinbelow with reference to the sequence listing part.

[9869] GAM714 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM714 target RNA, herein designated GAM TARGET RNA. GAM714 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9870] GAM714 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM714 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM714 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM714 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM714 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9871] The complementary binding of GAM714 RNA, herein designated GAM RNA, to target binding sites on GAM714 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM714 target RNA, herein designated GAM TARGET RNA, into GAM714 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9872] It is appreciated that GAM714 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM714 target genes. The mRNA of each one of this plurality of GAM714 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM714 RNA, herein designated GAM RNA, and which when bound by GAM714 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM714 target proteins.

[9873] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM714 gene, herein designated GAM GENE, on one or more GAM714 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9874] It is yet further appreciated that specific functions, and accordingly utilities, of GAM714 correlate with, and may be deduced from, the identity of the target genes which GAM714 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9875] Nucleotide sequences of the GAM714 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM714 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM714 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM714 are further described hereinbelow with reference to Table 1.

[9876] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM714 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9877] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 715 (GAM715) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9878] GAM715 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM715 was detected is

described hereinabove with reference to Figs. 2-8.

[9879] GAM715 gene, herein designated GAM GENE, and GAM715 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9880] GAM715 gene, herein designated GAM GENE, encodes a GAM715 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM715 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM715 precursor RNA is designated SEQ ID:692, and is provided hereinbelow with reference to the sequence listing part.

[9881] GAM715 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM715 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9882] An enzyme complex designated DICER COMPLEX, dices the GAM715 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM715 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM715 RNA is designated SEQ ID:3292, and is provided hereinbelow with reference to the sequence listing part.

[9883] GAM715 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM715 target RNA, herein designated GAM TARGET RNA. GAM715 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9884] GAM715 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM715 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM715 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM715 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM715 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9885] The complementary binding of GAM715 RNA, herein designated GAM RNA, to target binding sites on GAM715 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM715 target RNA, herein designated GAM TARGET RNA, into GAM715 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9886] It is appreciated that GAM715 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM715 target genes. The mRNA of each one of this plurality of GAM715 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM715 RNA, herein designated GAM RNA, and which when bound by GAM715 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM715 target proteins.

[9887] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM715 gene, herein designated GAM GENE, on one or more GAM715 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9888] It is yet further appreciated that specific functions, and accordingly utilities, of GAM715 correlate with, and may be deduced from, the identity of the target genes which GAM715 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9889] Nucleotide sequences of the GAM715 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM715 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM715 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM715 are further described hereinbelow with reference to Table 1.

[9890] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM715 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9891] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 716 (GAM716) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9892] GAM716 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM716 was detected is described hereinabove with reference to Figs. 2-8.

[9893] GAM716 gene, herein designated GAM GENE, and GAM716 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9894] GAM716 gene, herein designated GAM GENE, encodes a GAM716 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM716 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM716 precursor RNA is designated SEQ ID:693, and is provided hereinbelow with reference to the sequence listing part.

[9895] GAM716 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM716 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9896] An enzyme complex designated DICER COMPLEX, dices the GAM716 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM716 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM716 RNA is designated SEQ ID:3293, and is provided hereinbelow with reference to the sequence listing part.

[9897] GAM716 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM716 target RNA, herein designated GAM TARGET RNA. GAM716 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9898] GAM716 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM716 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM716 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM716 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM716 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9899] The complementary binding of GAM716 RNA, herein designated GAM RNA, to target binding sites on GAM716 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM716 target RNA, herein designated GAM TARGET RNA, into GAM716 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9900] It is appreciated that GAM716 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM716 target genes. The mRNA of each one of this plurality of GAM716 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM716 RNA, herein designated GAM RNA, and which when bound by GAM716 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM716 target proteins.

[9901] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM716 gene, herein designated GAM GENE, on one or more GAM716 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9902] It is yet further appreciated that specific functions, and accordingly utilities, of GAM716 correlate with, and may be deduced from, the identity of the target genes which GAM716 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9903] Nucleotide sequences of the GAM716 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM716 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM716 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM716 are further described hereinbelow with reference to Table 1.

[9904] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM716 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9905] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 717 (GAM717) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9906] GAM717 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM717 was detected is described hereinabove with reference to Figs. 2-8.

[9907] GAM717 gene, herein designated GAM GENE, and GAM717 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9908] GAM717 gene, herein designated GAM GENE, encodes a GAM717 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM717 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM717 precursor RNA is designated SEQ ID:694, and is provided hereinbelow with reference to the sequence listing part.

[9909] GAM717 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM717 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9910] An enzyme complex designated DICER COMPLEX, dices the GAM717 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM717 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM717 RNA is designated SEQ ID:3294, and is provided hereinbelow with reference to the sequence listing part.

[9911] GAM717 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM717 target RNA, herein designated GAM TARGET RNA. GAM717 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9912] GAM717 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM717 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM717 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM717 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM717 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9913] The complementary binding of GAM717 RNA, herein designated GAM RNA, to target binding sites on GAM717 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM717 target RNA, herein designated GAM TARGET RNA, into GAM717 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9914] It is appreciated that GAM717 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM717 target genes. The mRNA of each one of this plurality of GAM717 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM717 RNA, herein designated GAM RNA, and which when bound by GAM717 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM717 target proteins.

[9915] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM717 gene, herein designated GAM GENE, on one or more

GAM717 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9916] It is yet further appreciated that specific functions, and accordingly utilities, of GAM717 correlate with, and may be deduced from, the identity of the target genes which GAM717 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9917] Nucleotide sequences of the GAM717 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM717 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM717 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM717 are further described hereinbelow with reference to Table 1.

[9918] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM717 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9919] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 718 (GAM718) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9920] GAM718 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM718 was detected is described hereinabove with reference to Figs. 2-8.

[9921] GAM718 gene, herein designated GAM GENE, and GAM718 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9922] GAM718 gene, herein designated GAM GENE, encodes a GAM718 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM718 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM718 precursor RNA is designated SEQ ID:695, and is provided hereinbelow with reference to the sequence listing part.

[9923] GAM718 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM718 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9924] An enzyme complex designated DICER COMPLEX, dices the GAM718 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM718 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM718 RNA is designated SEQ ID:3297, and is provided hereinbelow with reference to the sequence listing part.

[9925] GAM718 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM718 target RNA, herein designated GAM TARGET RNA. GAM718 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9926] GAM718 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM718 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM718 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM718 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM718 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9927] The complementary binding of GAM718 RNA, herein designated GAM RNA, to target binding sites on GAM718 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM718 target RNA, herein designated GAM TARGET RNA, into GAM718 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9928] It is appreciated that GAM718 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM718 target genes. The mRNA of each one of this plurality of GAM718 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM718 RNA, herein designated GAM RNA, and which when bound by GAM718 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM718 target proteins.

[9929] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM718 gene, herein designated GAM GENE, on one or more GAM718 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9930] It is yet further appreciated that specific functions, and accordingly utilities, of GAM718 correlate with, and may be deduced from, the identity of the target genes which GAM718 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9931] Nucleotide sequences of the GAM718 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM718 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM718 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM718 are further described hereinbelow with reference to Table 1.

[9932] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM718 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9933] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 719 (GAM719) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9934] GAM719 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM719 was detected is described hereinabove with reference to Figs. 2-8.

[9935] GAM719 gene, herein designated GAM GENE, and GAM719 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9936] GAM719 gene, herein designated GAM GENE, encodes a GAM719 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM719 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM719 precursor RNA is designated SEQ ID:696, and is provided hereinbelow with reference to the sequence listing part.

[9937] GAM719 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM719 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9938] An enzyme complex designated DICER COMPLEX, dices the GAM719 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM719 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM719 RNA is designated SEQ ID:3298, and is provided hereinbelow with reference to the sequence listing part.

[9939] GAM719 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM719 target RNA, herein designated GAM TARGET RNA. GAM719 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9940] GAM719 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM719

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM719 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM719 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM719 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9941] The complementary binding of GAM719 RNA, herein designated GAM RNA, to target binding sites on GAM719 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM719 target RNA, herein designated GAM TARGET RNA, into GAM719 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9942] It is appreciated that GAM719 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM719 target genes. The mRNA of each one of this plurality of GAM719 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM719 RNA, herein designated GAM RNA, and which when bound by GAM719 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM719 target proteins.

[9943] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM719 gene, herein designated GAM GENE, on one or more GAM719 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9944] It is yet further appreciated that specific functions, and accordingly utilities, of GAM719 correlate with, and may be deduced from, the identity of the target genes which GAM719 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9945] Nucleotide sequences of the GAM719 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM719 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM719 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM719 are further described hereinbelow with

reference to Table 1.

[9946] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM719 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9947] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 720 (GAM720) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9948] GAM720 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM720 was detected is described hereinabove with reference to Figs. 2-8.

[9949] GAM720 gene, herein designated GAM GENE, and GAM720 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9950] GAM720 gene, herein designated GAM GENE, encodes a GAM720 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM720 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM720 precursor RNA is designated SEQ ID:697, and is provided

hereinbelow with reference to the sequence listing part.

[9951] GAM720 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM720 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9952] An enzyme complex designated DICER COMPLEX, dices the GAM720 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM720 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM720 RNA is designated SEQ ID:3299, and is provided hereinbelow with reference to the sequence listing part.

[9953] GAM720 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM720 target RNA, herein designated GAM TARGET RNA. GAM720 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[9954] GAM720 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM720 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM720 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM720 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM720 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9955] The complementary binding of GAM720 RNA, herein designated GAM RNA, to target binding sites on GAM720 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM720 target RNA, herein designated GAM TARGET RNA, into GAM720 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9956] It is appreciated that GAM720 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM720 target genes. The mRNA of each one of this plurality of GAM720 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM720 RNA, herein designated GAM RNA, and which when bound by GAM720 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM720 target proteins.

[9957] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM720 gene, herein designated GAM GENE, on one or more GAM720 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9958] It is yet further appreciated that specific functions, and accordingly utilities, of GAM720 correlate with, and may be deduced from, the identity of the target genes which GAM720 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9959] Nucleotide sequences of the GAM720 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM720 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM720 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM720 are further described hereinbelow with reference to Table 1.

[9960] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM720 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9961] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 721 (GAM721) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9962] GAM721 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM721 was detected is described hereinabove with reference to Figs. 2-8.

[9963] GAM721 gene, herein designated GAM GENE, and GAM721 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9964] GAM721 gene, herein designated GAM GENE, encodes a GAM721 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM721 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM721 precursor RNA is designated SEQ ID:698, and is provided hereinbelow with reference to the sequence listing part.

[9965] GAM721 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM721 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9966] An enzyme complex designated DICER COMPLEX, dices the GAM721 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM721 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM721 RNA is designated SEQ ID:3300, and is provided hereinbelow with reference to the sequence listing part.

[9967] GAM721 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM721 target RNA, herein designated

GAM TARGET RNA. GAM721 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9968] GAM721 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM721 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM721 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM721 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM721 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9969] The complementary binding of GAM721 RNA, herein designated GAM RNA, to target binding sites on GAM721 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM721 target RNA, herein designated GAM

TARGET RNA, into GAM721 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9970] It is appreciated that GAM721 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM721 target genes. The mRNA of each one of this plurality of GAM721 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM721 RNA, herein designated GAM RNA, and which when bound by GAM721 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM721 target proteins.

[9971] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM721 gene, herein designated GAM GENE, on one or more GAM721 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9972] It is yet further appreciated that specific functions, and accordingly utilities, of GAM721 correlate with, and may be deduced from, the identity of the target

genes which GAM721 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9973] Nucleotide sequences of the GAM721 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM721 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM721 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM721 are further described hereinbelow with reference to Table 1.

[9974] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM721 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9975] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 722 (GAM722) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9976] GAM722 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM722 was detected is described hereinabove with reference to Figs. 2-8.

[9977] GAM722 gene, herein designated GAM GENE, and GAM722 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[9978] GAM722 gene, herein designated GAM GENE, encodes a GAM722 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM722 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM722 precursor RNA is designated SEQ ID:699, and is provided hereinbelow with reference to the sequence listing part.

[9979] GAM722 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM722 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9980] An enzyme complex designated DICER COMPLEX, dices the GAM722 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM722 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM722 RNA is designated SEQ ID:3302, and is provided

hereinbelow with reference to the sequence listing part.

[9981] GAM722 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM722 target RNA, herein designated GAM TARGET RNA. GAM722 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9982] GAM722 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM722 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM722 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM722 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM722 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9983] The complementary binding of GAM722 RNA, herein designated GAM RNA, to target binding sites on GAM722 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM722 target RNA, herein designated GAM TARGET RNA, into GAM722 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9984] It is appreciated that GAM722 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM722 target genes. The mRNA of each one of this plurality of GAM722 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM722 RNA, herein designated GAM RNA, and which when bound by GAM722 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM722 target proteins.

[9985] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM722 gene, herein designated GAM GENE, on one or more GAM722 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9986] It is yet further appreciated that specific functions, and accordingly utilities, of GAM722 correlate with, and may be deduced from, the identity of the target genes which GAM722 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9987] Nucleotide sequences of the GAM722 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM722 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM722 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM722 are further described hereinbelow with reference to Table 1.

[9988] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM722 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[9989] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 723 (GAM723) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[9990] GAM723 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM723 was detected is

described hereinabove with reference to Figs. 2-8.

[9991] GAM723 gene, herein designated GAM GENE, and GAM723 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[9992] GAM723 gene, herein designated GAM GENE, encodes a GAM723 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM723 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM723 precursor RNA is designated SEQ ID:700, and is provided hereinbelow with reference to the sequence listing part.

[9993] GAM723 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM723 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9994] An enzyme complex designated DICER COMPLEX, dices the GAM723 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM723 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM723 RNA is designated SEQ ID:3301, and is provided hereinbelow with reference to the sequence listing part.

[9995] GAM723 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM723 target RNA, herein designated GAM TARGET RNA. GAM723 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9996] GAM723 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM723 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM723 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM723 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM723 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9997] The complementary binding of GAM723 RNA, herein designated GAM RNA, to target binding sites on GAM723 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM723 target RNA, herein designated GAM TARGET RNA, into GAM723 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[9998] It is appreciated that GAM723 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM723 target genes. The mRNA of each one of this plurality of GAM723 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM723 RNA, herein designated GAM RNA, and which when bound by GAM723 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM723 target proteins.

[9999] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM723 gene, herein designated GAM GENE, on one or more GAM723 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10000] It is yet further appreciated that specific functions, and accordingly utilities, of GAM723 correlate with, and may be deduced from, the identity of the target genes which GAM723 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10001] Nucleotide sequences of the GAM723 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM723 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM723 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM723 are further described hereinbelow with reference to Table 1.

[10002] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM723 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10003] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 724 (GAM724) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10004] GAM724 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM724 was detected is described hereinabove with reference to Figs. 2-8.

[10005] GAM724 gene, herein designated GAM GENE, and GAM724 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10006] GAM724 gene, herein designated GAM GENE, encodes a GAM724 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM724 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM724 precursor RNA is designated SEQ ID:701, and is provided hereinbelow with reference to the sequence listing part.

[10007] GAM724 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM724 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10008] An enzyme complex designated DICER COMPLEX, dices the GAM724 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM724 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM724 RNA is designated SEQ ID:3304, and is provided hereinbelow with reference to the sequence listing part.

[10009] GAM724 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM724 target RNA, herein designated GAM TARGET RNA. GAM724 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10010] GAM724 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM724 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM724 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM724 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM724 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10011] The complementary binding of GAM724 RNA, herein designated GAM RNA, to target binding sites on GAM724 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM724 target RNA, herein designated GAM TARGET RNA, into GAM724 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10012] It is appreciated that GAM724 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM724 target genes. The mRNA of each one of this plurality of GAM724 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM724 RNA, herein designated GAM RNA, and which when bound by GAM724 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM724 target proteins.

[10013] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM724 gene, herein designated GAM GENE, on one or more GAM724 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10014] It is yet further appreciated that specific functions, and accordingly utilities, of GAM724 correlate with, and may be deduced from, the identity of the target genes which GAM724 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10015] Nucleotide sequences of the GAM724 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM724 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM724 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM724 are further described hereinbelow with reference to Table 1.

[10016] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM724 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10017] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 725 (GAM725) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10018] GAM725 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM725 was detected is described hereinabove with reference to Figs. 2-8.

[10019] GAM725 gene, herein designated GAM GENE, and GAM725 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10020] GAM725 gene, herein designated GAM GENE, encodes a GAM725 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM725 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM725 precursor RNA is designated SEQ ID:702, and is provided hereinbelow with reference to the sequence listing part.

[10021] GAM725 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM725 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10022] An enzyme complex designated DICER COMPLEX, dices the GAM725 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM725 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM725 RNA is designated SEQ ID:3303, and is provided hereinbelow with reference to the sequence listing part.

[10023] GAM725 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM725 target RNA, herein designated GAM TARGET RNA. GAM725 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10024] GAM725 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM725 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM725 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM725 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM725 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10025] The complementary binding of GAM725 RNA, herein designated GAM RNA, to target binding sites on GAM725 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM725 target RNA, herein designated GAM TARGET RNA, into GAM725 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10026] It is appreciated that GAM725 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM725 target genes. The mRNA of each one of this plurality of GAM725 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM725 RNA, herein designated GAM RNA, and which when bound by GAM725 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM725 target proteins.

[10027] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM725 gene, herein designated GAM GENE, on one or more

GAM725 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10028] It is yet further appreciated that specific functions, and accordingly utilities, of GAM725 correlate with, and may be deduced from, the identity of the target genes which GAM725 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10029] Nucleotide sequences of the GAM725 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM725 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM725 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM725 are further described hereinbelow with reference to Table 1.

[10030] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM725 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10031] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 726 (GAM726) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10032] GAM726 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM726 was detected is described hereinabove with reference to Figs. 2-8.

[10033] GAM726 gene, herein designated GAM GENE, and GAM726 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10034] GAM726 gene, herein designated GAM GENE, encodes a GAM726 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM726 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM726 precursor RNA is designated SEQ ID:703, and is provided hereinbelow with reference to the sequence listing part.

[10035] GAM726 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM726 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10036] An enzyme complex designated DICER COMPLEX, dices the GAM726 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM726 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM726 RNA is designated SEQ ID:3305, and is provided hereinbelow with reference to the sequence listing part.

[10037] GAM726 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM726 target RNA, herein designated GAM TARGET RNA. GAM726 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10038] GAM726 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM726 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM726 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM726 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM726 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10039] The complementary binding of GAM726 RNA, herein designated GAM RNA, to target binding sites on GAM726 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM726 target RNA, herein designated GAM TARGET RNA, into GAM726 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10040] It is appreciated that GAM726 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM726 target genes. The mRNA of each one of this plurality of GAM726 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM726 RNA, herein designated GAM RNA, and which when bound by GAM726 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM726 target proteins.

[10041] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM726 gene, herein designated GAM GENE, on one or more GAM726 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10042] It is yet further appreciated that specific functions, and accordingly utilities, of GAM726 correlate with, and may be deduced from, the identity of the target genes which GAM726 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10043] Nucleotide sequences of the GAM726 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM726 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM726 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM726 are further described hereinbelow with reference to Table 1.

[10044] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM726 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10045] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 727 (GAM727) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10046] GAM727 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM727 was detected is described hereinabove with reference to Figs. 2-8.

[10047] GAM727 gene, herein designated GAM GENE, and GAM727 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10048] GAM727 gene, herein designated GAM GENE, encodes a GAM727 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM727 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM727 precursor RNA is designated SEQ ID:704, and is provided hereinbelow with reference to the sequence listing part.

[10049] GAM727 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM727 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10050] An enzyme complex designated DICER COMPLEX, dices the GAM727 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM727 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM727 RNA is designated SEQ ID:3306, and is provided hereinbelow with reference to the sequence listing part.

[10051] GAM727 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM727 target RNA, herein designated GAM TARGET RNA. GAM727 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10052] GAM727 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM727

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM727 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM727 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM727 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10053] The complementary binding of GAM727 RNA, herein designated GAM RNA, to target binding sites on GAM727 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM727 target RNA, herein designated GAM TARGET RNA, into GAM727 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10054] It is appreciated that GAM727 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM727 target genes. The mRNA of each one of this plurality of GAM727 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM727 RNA, herein designated GAM RNA, and which when bound by GAM727 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM727 target proteins.

[10055] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM727 gene, herein designated GAM GENE, on one or more GAM727 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10056] It is yet further appreciated that specific functions, and accordingly utilities, of GAM727 correlate with, and may be deduced from, the identity of the target genes which GAM727 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10057] Nucleotide sequences of the GAM727 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM727 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM727 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM727 are further described hereinbelow with

reference to Table 1.

[10058] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM727 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10059] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 728 (GAM728) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10060] GAM728 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM728 was detected is described hereinabove with reference to Figs. 2-8.

[10061] GAM728 gene, herein designated GAM GENE, and GAM728 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10062] GAM728 gene, herein designated GAM GENE, encodes a GAM728 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM728 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM728 precursor RNA is designated SEQ ID:705, and is provided

hereinbelow with reference to the sequence listing part.

[10063] GAM728 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM728 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10064] An enzyme complex designated DICER COMPLEX, dices the GAM728 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM728 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM728 RNA is designated SEQ ID:3307, and is provided hereinbelow with reference to the sequence listing part.

[10065] GAM728 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM728 target RNA, herein designated GAM TARGET RNA. GAM728 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[10066] GAM728 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM728 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM728 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM728 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM728 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10067] The complementary binding of GAM728 RNA, herein designated GAM RNA, to target binding sites on GAM728 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM728 target RNA, herein designated GAM TARGET RNA, into GAM728 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10068] It is appreciated that GAM728 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM728 target genes. The mRNA of each one of this plurality of GAM728 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM728 RNA, herein designated GAM RNA, and which when bound by GAM728 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM728 target proteins.

[10069] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM728 gene, herein designated GAM GENE, on one or more GAM728 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10070] It is yet further appreciated that specific functions, and accordingly utilities, of GAM728 correlate with, and may be deduced from, the identity of the target genes which GAM728 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10071] Nucleotide sequences of the GAM728 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM728 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM728 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM728 are further described hereinbelow with reference to Table 1.

[10072] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM728 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10073] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 729 (GAM729) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10074] GAM729 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM729 was detected is described hereinabove with reference to Figs. 2-8.

[10075] GAM729 gene, herein designated GAM GENE, and GAM729 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10076] GAM729 gene, herein designated GAM GENE, encodes a GAM729 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM729 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM729 precursor RNA is designated SEQ ID:706, and is provided hereinbelow with reference to the sequence listing part.

[10077] GAM729 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM729 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10078] An enzyme complex designated DICER COMPLEX, dices the GAM729 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM729 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM729 RNA is designated SEQ ID:3308, and is provided hereinbelow with reference to the sequence listing part.

[10079] GAM729 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM729 target RNA, herein designated

GAM TARGET RNA. GAM729 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10080] GAM729 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM729 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM729 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM729 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM729 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10081] The complementary binding of GAM729 RNA, herein designated GAM RNA, to target binding sites on GAM729 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM729 target RNA, herein designated GAM

TARGET RNA, into GAM729 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10082] It is appreciated that GAM729 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM729 target genes. The mRNA of each one of this plurality of GAM729 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM729 RNA, herein designated GAM RNA, and which when bound by GAM729 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM729 target proteins.

[10083] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM729 gene, herein designated GAM GENE, on one or more GAM729 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10084] It is yet further appreciated that specific functions, and accordingly utilities, of GAM729 correlate with, and may be deduced from, the identity of the target

genes which GAM729 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10085] Nucleotide sequences of the GAM729 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM729 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM729 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM729 are further described hereinbelow with reference to Table 1.

[10086] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM729 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10087] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 730 (GAM730) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10088] GAM730 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM730 was detected is described hereinabove with reference to Figs. 2-8.

[10089] GAM730 gene, herein designated GAM GENE, and GAM730 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[10090] GAM730 gene, herein designated GAM GENE, encodes a GAM730 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM730 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM730 precursor RNA is designated SEQ ID:707, and is provided hereinbelow with reference to the sequence listing part.

[10091] GAM730 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM730 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10092] An enzyme complex designated DICER COMPLEX, dices the GAM730 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM730 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM730 RNA is designated SEQ ID:3309, and is provided

hereinbelow with reference to the sequence listing part.

[10093] GAM730 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM730 target RNA, herein designated GAM TARGET RNA. GAM730 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10094] GAM730 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM730 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM730 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM730 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM730 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10095] The complementary binding of GAM730 RNA, herein designated GAM RNA, to target binding sites on GAM730 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM730 target RNA, herein designated GAM TARGET RNA, into GAM730 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10096] It is appreciated that GAM730 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM730 target genes. The mRNA of each one of this plurality of GAM730 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM730 RNA, herein designated GAM RNA, and which when bound by GAM730 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM730 target proteins.

[10097] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM730 gene, herein designated GAM GENE, on one or more GAM730 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10098] It is yet further appreciated that specific functions, and accordingly utilities, of GAM730 correlate with, and may be deduced from, the identity of the target genes which GAM730 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10099] Nucleotide sequences of the GAM730 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM730 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM730 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM730 are further described hereinbelow with reference to Table 1.

[10100] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM730 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10101] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 731 (GAM731) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10102] GAM731 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM731 was detected is

described hereinabove with reference to Figs. 2-8.

[10103] GAM731 gene, herein designated GAM GENE, and GAM731 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10104] GAM731 gene, herein designated GAM GENE, encodes a GAM731 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM731 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM731 precursor RNA is designated SEQ ID:708, and is provided hereinbelow with reference to the sequence listing part.

[10105] GAM731 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM731 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10106] An enzyme complex designated DICER COMPLEX, dices the GAM731 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM731 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM731 RNA is designated SEQ ID:3310, and is provided hereinbelow with reference to the sequence listing part.

[10107] GAM731 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM731 target RNA, herein designated GAM TARGET RNA. GAM731 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10108] GAM731 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM731 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM731 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM731 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM731 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10109] The complementary binding of GAM731 RNA, herein designated GAM RNA, to target binding sites on GAM731 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM731 target RNA, herein designated GAM TARGET RNA, into GAM731 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10110] It is appreciated that GAM731 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM731 target genes. The mRNA of each one of this plurality of GAM731 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM731 RNA, herein designated GAM RNA, and which when bound by GAM731 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM731 target proteins.

[10111] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM731 gene, herein designated GAM GENE, on one or more GAM731 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10112] It is yet further appreciated that specific functions, and accordingly utilities, of GAM731 correlate with, and may be deduced from, the identity of the target genes which GAM731 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10113] Nucleotide sequences of the GAM731 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM731 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM731 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM731 are further described hereinbelow with reference to Table 1.

[10114] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM731 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10115] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 732 (GAM732) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10116] GAM732 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM732 was detected is described hereinabove with reference to Figs. 2-8.

[10117] GAM732 gene, herein designated GAM GENE, and GAM732 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10118] GAM732 gene, herein designated GAM GENE, encodes a GAM732 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM732 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM732 precursor RNA is designated SEQ ID:709, and is provided hereinbelow with reference to the sequence listing part.

[10119] GAM732 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM732 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10120] An enzyme complex designated DICER COMPLEX, dices the GAM732 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM732 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM732 RNA is designated SEQ ID:3311, and is provided hereinbelow with reference to the sequence listing part.

[10121] GAM732 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM732 target RNA, herein designated GAM TARGET RNA. GAM732 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10122] GAM732 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM732 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM732 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM732 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM732 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10123] The complementary binding of GAM732 RNA, herein designated GAM RNA, to target binding sites on GAM732 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM732 target RNA, herein designated GAM TARGET RNA, into GAM732 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10124] It is appreciated that GAM732 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM732 target genes. The mRNA of each one of this plurality of GAM732 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM732 RNA, herein designated GAM RNA, and which when bound by GAM732 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM732 target proteins.

[10125] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM732 gene, herein designated GAM GENE, on one or more GAM732 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10126] It is yet further appreciated that specific functions, and accordingly utilities, of GAM732 correlate with, and may be deduced from, the identity of the target genes which GAM732 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10127] Nucleotide sequences of the GAM732 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM732 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM732 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM732 are further described hereinbelow with reference to Table 1.

[10128] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM732 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10129] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 733 (GAM733) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10130] GAM733 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM733 was detected is described hereinabove with reference to Figs. 2-8.

[10131] GAM733 gene, herein designated GAM GENE, and GAM733 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10132] GAM733 gene, herein designated GAM GENE, encodes a GAM733 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM733 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM733 precursor RNA is designated SEQ ID:710, and is provided hereinbelow with reference to the sequence listing part.

[10133] GAM733 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM733 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10134] An enzyme complex designated DICER COMPLEX, dices the GAM733 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM733 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM733 RNA is designated SEQ ID:3312, and is provided hereinbelow with reference to the sequence listing part.

[10135] GAM733 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM733 target RNA, herein designated GAM TARGET RNA. GAM733 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10136] GAM733 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM733 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM733 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM733 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM733 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10137] The complementary binding of GAM733 RNA, herein designated GAM RNA, to target binding sites on GAM733 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM733 target RNA, herein designated GAM TARGET RNA, into GAM733 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10138] It is appreciated that GAM733 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM733 target genes. The mRNA of each one of this plurality of GAM733 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM733 RNA, herein designated GAM RNA, and which when bound by GAM733 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM733 target proteins.

[10139] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM733 gene, herein designated GAM GENE, on one or more

GAM733 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10140] It is yet further appreciated that specific functions, and accordingly utilities, of GAM733 correlate with, and may be deduced from, the identity of the target genes which GAM733 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10141] Nucleotide sequences of the GAM733 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM733 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM733 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM733 are further described hereinbelow with reference to Table 1.

[10142] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM733 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10143] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 734 (GAM734) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10144] GAM734 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM734 was detected is described hereinabove with reference to Figs. 2-8.

[10145] GAM734 gene, herein designated GAM GENE, and GAM734 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10146] GAM734 gene, herein designated GAM GENE, encodes a GAM734 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM734 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM734 precursor RNA is designated SEQ ID:711, and is provided hereinbelow with reference to the sequence listing part.

[10147] GAM734 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM734 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10148] An enzyme complex designated DICER COMPLEX, dices the GAM734 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM734 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM734 RNA is designated SEQ ID:3314, and is provided hereinbelow with reference to the sequence listing part.

[10149] GAM734 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM734 target RNA, herein designated GAM TARGET RNA. GAM734 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10150] GAM734 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM734 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM734 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM734 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM734 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10151] The complementary binding of GAM734 RNA, herein designated GAM RNA, to target binding sites on GAM734 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM734 target RNA, herein designated GAM TARGET RNA, into GAM734 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10152] It is appreciated that GAM734 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM734 target genes. The mRNA of each one of this plurality of GAM734 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM734 RNA, herein designated GAM RNA, and which when bound by GAM734 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM734 target proteins.

[10153] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM734 gene, herein designated GAM GENE, on one or more GAM734 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10154] It is yet further appreciated that specific functions, and accordingly utilities, of GAM734 correlate with, and may be deduced from, the identity of the target genes which GAM734 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10155] Nucleotide sequences of the GAM734 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM734 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM734 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM734 are further described hereinbelow with reference to Table 1.

[10156] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM734 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10157] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 735 (GAM735) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10158] GAM735 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM735 was detected is described hereinabove with reference to Figs. 2-8.

[10159] GAM735 gene, herein designated GAM GENE, and GAM735 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10160] GAM735 gene, herein designated GAM GENE, encodes a GAM735 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM735 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM735 precursor RNA is designated SEQ ID:712, and is provided hereinbelow with reference to the sequence listing part.

[10161] GAM735 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM735 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10162] An enzyme complex designated DICER COMPLEX, dices the GAM735 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM735 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM735 RNA is designated SEQ ID:3313, and is provided hereinbelow with reference to the sequence listing part.

[10163] GAM735 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM735 target RNA, herein designated GAM TARGET RNA. GAM735 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10164] GAM735 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM735

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM735 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM735 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM735 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10165] The complementary binding of GAM735 RNA, herein designated GAM RNA, to target binding sites on GAM735 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM735 target RNA, herein designated GAM TARGET RNA, into GAM735 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10166] It is appreciated that GAM735 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM735 target genes. The mRNA of each one of this plurality of GAM735 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM735 RNA, herein designated GAM RNA, and which when bound by GAM735 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM735 target proteins.

[10167] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM735 gene, herein designated GAM GENE, on one or more GAM735 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10168] It is yet further appreciated that specific functions, and accordingly utilities, of GAM735 correlate with, and may be deduced from, the identity of the target genes which GAM735 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10169] Nucleotide sequences of the GAM735 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM735 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM735 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM735 are further described hereinbelow with

reference to Table 1.

[10170] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM735 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10171] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 736 (GAM736) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10172] GAM736 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM736 was detected is described hereinabove with reference to Figs. 2-8.

[10173] GAM736 gene, herein designated GAM GENE, and GAM736 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10174] GAM736 gene, herein designated GAM GENE, encodes a GAM736 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM736 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM736 precursor RNA is designated SEQ ID:713, and is provided

hereinbelow with reference to the sequence listing part.

[10175] GAM736 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM736 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10176] An enzyme complex designated DICER COMPLEX, dices the GAM736 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM736 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM736 RNA is designated SEQ ID:3315, and is provided hereinbelow with reference to the sequence listing part.

[10177] GAM736 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM736 target RNA, herein designated GAM TARGET RNA. GAM736 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[10178] GAM736 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM736 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM736 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM736 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM736 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10179] The complementary binding of GAM736 RNA, herein designated GAM RNA, to target binding sites on GAM736 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM736 target RNA, herein designated GAM TARGET RNA, into GAM736 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10180] It is appreciated that GAM736 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM736 target genes. The mRNA of each one of this plurality of GAM736 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM736 RNA, herein designated GAM RNA, and which when bound by GAM736 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM736 target proteins.

[10181] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM736 gene, herein designated GAM GENE, on one or more GAM736 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10182] It is yet further appreciated that specific functions, and accordingly utilities, of GAM736 correlate with, and may be deduced from, the identity of the target genes which GAM736 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10183] Nucleotide sequences of the GAM736 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM736 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM736 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM736 are further described hereinbelow with reference to Table 1.

[10184] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM736 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10185] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 737 (GAM737) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10186] GAM737 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM737 was detected is described hereinabove with reference to Figs. 2-8.

[10187] GAM737 gene, herein designated GAM GENE, and GAM737 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10188] GAM737 gene, herein designated GAM GENE, encodes a GAM737 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM737 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM737 precursor RNA is designated SEQ ID:714, and is provided hereinbelow with reference to the sequence listing part.

[10189] GAM737 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM737 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10190] An enzyme complex designated DICER COMPLEX, dices the GAM737 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM737 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM737 RNA is designated SEQ ID:3316, and is provided hereinbelow with reference to the sequence listing part.

[10191] GAM737 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM737 target RNA, herein designated

GAM TARGET RNA. GAM737 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10192] GAM737 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM737 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM737 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM737 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM737 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10193] The complementary binding of GAM737 RNA, herein designated GAM RNA, to target binding sites on GAM737 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM737 target RNA, herein designated GAM

TARGET RNA, into GAM737 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10194] It is appreciated that GAM737 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM737 target genes. The mRNA of each one of this plurality of GAM737 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM737 RNA, herein designated GAM RNA, and which when bound by GAM737 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM737 target proteins.

[10195] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM737 gene, herein designated GAM GENE, on one or more GAM737 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10196] It is yet further appreciated that specific functions, and accordingly utilities, of GAM737 correlate with, and may be deduced from, the identity of the target

genes which GAM737 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10197] Nucleotide sequences of the GAM737 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM737 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM737 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM737 are further described hereinbelow with reference to Table 1.

[10198] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM737 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10199] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 738 (GAM738) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10200] GAM738 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM738 was detected is described hereinabove with reference to Figs. 2-8.

[10201] GAM738 gene, herein designated GAM GENE, and GAM738 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[10202] GAM738 gene, herein designated GAM GENE, encodes a GAM738 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM738 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM738 precursor RNA is designated SEQ ID:715, and is provided hereinbelow with reference to the sequence listing part.

[10203] GAM738 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM738 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10204] An enzyme complex designated DICER COMPLEX, dices the GAM738 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM738 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM738 RNA is designated SEQ ID:3317, and is provided

hereinbelow with reference to the sequence listing part.

[10205] GAM738 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM738 target RNA, herein designated GAM TARGET RNA. GAM738 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10206] GAM738 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM738 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM738 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM738 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM738 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10207] The complementary binding of GAM738 RNA, herein designated GAM RNA, to target binding sites on GAM738 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM738 target RNA, herein designated GAM TARGET RNA, into GAM738 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10208] It is appreciated that GAM738 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM738 target genes. The mRNA of each one of this plurality of GAM738 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM738 RNA, herein designated GAM RNA, and which when bound by GAM738 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM738 target proteins.

[10209] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM738 gene, herein designated GAM GENE, on one or more GAM738 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10210] It is yet further appreciated that specific functions, and accordingly utilities, of GAM738 correlate with, and may be deduced from, the identity of the target genes which GAM738 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10211] Nucleotide sequences of the GAM738 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM738 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM738 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM738 are further described hereinbelow with reference to Table 1.

[10212] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM738 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10213] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 739 (GAM739) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10214] GAM739 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM739 was detected is

described hereinabove with reference to Figs. 2-8.

[10215] GAM739 gene, herein designated GAM GENE, and GAM739 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10216] GAM739 gene, herein designated GAM GENE, encodes a GAM739 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM739 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM739 precursor RNA is designated SEQ ID:716, and is provided hereinbelow with reference to the sequence listing part.

[10217] GAM739 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM739 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10218] An enzyme complex designated DICER COMPLEX, dices the GAM739 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM739 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM739 RNA is designated SEQ ID:3318, and is provided hereinbelow with reference to the sequence listing part.

[10219] GAM739 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM739 target RNA, herein designated GAM TARGET RNA. GAM739 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10220] GAM739 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM739 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM739 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM739 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM739 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10221] The complementary binding of GAM739 RNA, herein designated GAM RNA, to target binding sites on GAM739 target RNA, herein designated GAM

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM739 target RNA, herein designated GAM TARGET RNA, into GAM739 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10222] It is appreciated that GAM739 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM739 target genes. The mRNA of each one of this plurality of GAM739 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM739 RNA, herein designated GAM RNA, and which when bound by GAM739 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM739 target proteins.

[10223] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM739 gene, herein designated GAM GENE, on one or more GAM739 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10224] It is yet further appreciated that specific functions, and accordingly utilities, of GAM739 correlate with, and may be deduced from, the identity of the target genes which GAM739 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10225] Nucleotide sequences of the GAM739 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM739 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM739 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM739 are further described hereinbelow with reference to Table 1.

[10226] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM739 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10227] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 740 (GAM740) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10228] GAM740 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM740 was detected is described hereinabove with reference to Figs. 2-8.

[10229] GAM740 gene, herein designated GAM GENE, and GAM740 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10230] GAM740 gene, herein designated GAM GENE, encodes a GAM740 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM740 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM740 precursor RNA is designated SEQ ID:717, and is provided hereinbelow with reference to the sequence listing part.

[10231] GAM740 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM740 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10232] An enzyme complex designated DICER COMPLEX, dices the GAM740 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM740 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM740 RNA is designated SEQ ID:3319, and is provided hereinbelow with reference to the sequence listing part.

[10233] GAM740 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM740 target RNA, herein designated GAM TARGET RNA. GAM740 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10234] GAM740 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM740 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM740 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM740 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM740 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[10235] The complementary binding of GAM740 RNA, herein designated GAM RNA, to target binding sites on GAM740 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM740 target RNA, herein designated GAM TARGET RNA, into GAM740 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10236] It is appreciated that GAM740 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM740 target genes. The mRNA of each one of this plurality of GAM740 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM740 RNA, herein designated GAM RNA, and which when bound by GAM740 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM740 target proteins.

[10237] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM740 gene, herein designated GAM GENE, on one or more GAM740 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other

genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10238] It is yet further appreciated that specific functions, and accordingly utilities, of GAM740 correlate with, and may be deduced from, the identity of the target genes which GAM740 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10239] Nucleotide sequences of the GAM740 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM740 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM740 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM740 are further described hereinbelow with reference to Table 1.

[10240] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM740 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10241] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 741 (GAM741) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10242] GAM741 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM741 was detected is described hereinabove with reference to Figs. 2-8.

[10243] GAM741 gene, herein designated GAM GENE, and GAM741 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10244] GAM741 gene, herein designated GAM GENE, encodes a GAM741 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM741 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM741 precursor RNA is designated SEQ ID:718, and is provided hereinbelow with reference to the sequence listing part.

[10245] GAM741 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM741 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10246] An enzyme complex designated DICER COMPLEX, dices the GAM741 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM741 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM741 RNA is designated SEQ ID:3320, and is provided hereinbelow with reference to the sequence listing part.

[10247] GAM741 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM741 target RNA, herein designated GAM TARGET RNA. GAM741 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10248] GAM741 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM741 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM741 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM741 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM741 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10249] The complementary binding of GAM741 RNA, herein designated GAM RNA, to target binding sites on GAM741 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM741 target RNA, herein designated GAM TARGET RNA, into GAM741 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10250] It is appreciated that GAM741 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM741 target genes. The mRNA of each one of this plurality of GAM741 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM741 RNA, herein designated GAM RNA, and which when bound by GAM741 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM741 target proteins.

[10251] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM741 gene, herein designated GAM GENE, on one or more GAM741 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10252] It is yet further appreciated that specific functions, and accordingly utilities, of GAM741 correlate with, and may be deduced from, the identity of the target genes which GAM741 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10253] Nucleotide sequences of the GAM741 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM741 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM741 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM741 are further described hereinbelow with reference to Table 1.

[10254] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM741 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10255] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 742 (GAM742) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10256] GAM742 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM742 was detected is described hereinabove with reference to Figs. 2-8.

[10257] GAM742 gene, herein designated GAM GENE, and GAM742 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10258] GAM742 gene, herein designated GAM GENE, encodes a GAM742 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM742 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM742 precursor RNA is designated SEQ ID:719, and is provided hereinbelow with reference to the sequence listing part.

[10259] GAM742 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM742 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10260] An enzyme complex designated DICER COMPLEX, dices the GAM742 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM742 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM742 RNA is designated SEQ ID:3321, and is provided hereinbelow with reference to the sequence listing part.

[10261] GAM742 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM742 target RNA, herein designated GAM TARGET RNA. GAM742 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10262] GAM742 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM742 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM742 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM742 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM742 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10263] The complementary binding of GAM742 RNA, herein designated GAM RNA, to target binding sites on GAM742 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM742 target RNA, herein designated GAM TARGET RNA, into GAM742 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10264] It is appreciated that GAM742 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM742 target genes. The mRNA of each one of this plurality of GAM742 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM742 RNA, herein designated GAM RNA, and which when bound by GAM742 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM742 target proteins.

[10265] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM742 gene, herein designated GAM GENE, on one or more

GAM742 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10266] It is yet further appreciated that specific functions, and accordingly utilities, of GAM742 correlate with, and may be deduced from, the identity of the target genes which GAM742 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10267] Nucleotide sequences of the GAM742 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM742 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM742 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM742 are further described hereinbelow with reference to Table 1.

[10268] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM742 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10269] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 743 (GAM743) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10270] GAM743 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM743 was detected is described hereinabove with reference to Figs. 2-8.

[10271] GAM743 gene, herein designated GAM GENE, and GAM743 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10272] GAM743 gene, herein designated GAM GENE, encodes a GAM743 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM743 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM743 precursor RNA is designated SEQ ID:720, and is provided hereinbelow with reference to the sequence listing part.

[10273] GAM743 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM743 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10274] An enzyme complex designated DICER COMPLEX, dices the GAM743 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM743 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM743 RNA is designated SEQ ID:3322, and is provided hereinbelow with reference to the sequence listing part.

[10275] GAM743 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM743 target RNA, herein designated GAM TARGET RNA. GAM743 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10276] GAM743 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM743 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM743 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM743 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM743 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10277] The complementary binding of GAM743 RNA, herein designated GAM RNA, to target binding sites on GAM743 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM743 target RNA, herein designated GAM TARGET RNA, into GAM743 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10278] It is appreciated that GAM743 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM743 target genes. The mRNA of each one of this plurality of GAM743 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM743 RNA, herein designated GAM RNA, and which when bound by GAM743 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM743 target proteins.

[10279] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM743 gene, herein designated GAM GENE, on one or more GAM743 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10280] It is yet further appreciated that specific functions, and accordingly utilities, of GAM743 correlate with, and may be deduced from, the identity of the target genes which GAM743 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10281] Nucleotide sequences of the GAM743 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM743 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM743 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM743 are further described hereinbelow with reference to Table 1.

[10282] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM743 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10283] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 744 (GAM744) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10284] GAM744 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM744 was detected is described hereinabove with reference to Figs. 2-8.

[10285] GAM744 gene, herein designated GAM GENE, and GAM744 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10286] GAM744 gene, herein designated GAM GENE, encodes a GAM744 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM744 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM744 precursor RNA is designated SEQ ID:721, and is provided hereinbelow with reference to the sequence listing part.

[10287] GAM744 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM744 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10288] An enzyme complex designated DICER COMPLEX, dices the GAM744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM744 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM744 RNA is designated SEQ ID:3323, and is provided hereinbelow with reference to the sequence listing part.

[10289] GAM744 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM744 target RNA, herein designated GAM TARGET RNA. GAM744 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10290] GAM744 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM744

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM744 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM744 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM744 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10291] The complementary binding of GAM744 RNA, herein designated GAM RNA, to target binding sites on GAM744 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM744 target RNA, herein designated GAM TARGET RNA, into GAM744 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10292] It is appreciated that GAM744 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM744 target genes. The mRNA of each one of this plurality of GAM744 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM744 RNA, herein designated GAM RNA, and which when bound by GAM744 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM744 target proteins.

[10293] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM744 gene, herein designated GAM GENE, on one or more GAM744 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10294] It is yet further appreciated that specific functions, and accordingly utilities, of GAM744 correlate with, and may be deduced from, the identity of the target genes which GAM744 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10295] Nucleotide sequences of the GAM744 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM744 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM744 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM744 are further described hereinbelow with

reference to Table 1.

[10296] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM744 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10297] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 745 (GAM745) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10298] GAM745 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM745 was detected is described hereinabove with reference to Figs. 2-8.

[10299] GAM745 gene, herein designated GAM GENE, and GAM745 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10300] GAM745 gene, herein designated GAM GENE, encodes a GAM745 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM745 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM745 precursor RNA is designated SEQ ID:722, and is provided

hereinbelow with reference to the sequence listing part.

[10301] GAM745 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM745 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10302] An enzyme complex designated DICER COMPLEX, dices the GAM745 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM745 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM745 RNA is designated SEQ ID:3324, and is provided hereinbelow with reference to the sequence listing part.

[10303] GAM745 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM745 target RNA, herein designated GAM TARGET RNA. GAM745 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[10304] GAM745 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM745 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM745 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM745 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM745 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10305] The complementary binding of GAM745 RNA, herein designated GAM RNA, to target binding sites on GAM745 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM745 target RNA, herein designated GAM TARGET RNA, into GAM745 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10306] It is appreciated that GAM745 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM745 target genes. The mRNA of each one of this plurality of GAM745 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM745 RNA, herein designated GAM RNA, and which when bound by GAM745 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM745 target proteins.

[10307] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM745 gene, herein designated GAM GENE, on one or more GAM745 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10308] It is yet further appreciated that specific functions, and accordingly utilities, of GAM745 correlate with, and may be deduced from, the identity of the target genes which GAM745 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10309] Nucleotide sequences of the GAM745 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM745 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM745 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM745 are further described hereinbelow with reference to Table 1.

[10310] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM745 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10311] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 746 (GAM746) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10312] GAM746 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM746 was detected is described hereinabove with reference to Figs. 2-8.

[10313] GAM746 gene, herein designated GAM GENE, and GAM746 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10314] GAM746 gene, herein designated GAM GENE, encodes a GAM746 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM746 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM746 precursor RNA is designated SEQ ID:723, and is provided hereinbelow with reference to the sequence listing part.

[10315] GAM746 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM746 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10316] An enzyme complex designated DICER COMPLEX, dices the GAM746 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM746 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM746 RNA is designated SEQ ID:3325, and is provided hereinbelow with reference to the sequence listing part.

[10317] GAM746 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM746 target RNA, herein designated

GAM TARGET RNA. GAM746 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10318] GAM746 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM746 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM746 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM746 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM746 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10319] The complementary binding of GAM746 RNA, herein designated GAM RNA, to target binding sites on GAM746 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM746 target RNA, herein designated GAM

TARGET RNA, into GAM746 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10320] It is appreciated that GAM746 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM746 target genes. The mRNA of each one of this plurality of GAM746 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM746 RNA, herein designated GAM RNA, and which when bound by GAM746 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM746 target proteins.

[10321] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM746 gene, herein designated GAM GENE, on one or more GAM746 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10322] It is yet further appreciated that specific functions, and accordingly utilities, of GAM746 correlate with, and may be deduced from, the identity of the target

genes which GAM746 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10323] Nucleotide sequences of the GAM746 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM746 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM746 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM746 are further described hereinbelow with reference to Table 1.

[10324] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM746 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10325] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 747 (GAM747) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10326] GAM747 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM747 was detected is described hereinabove with reference to Figs. 2-8.

[10327] GAM747 gene, herein designated GAM GENE, and GAM747 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[10328] GAM747 gene, herein designated GAM GENE, encodes a GAM747 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM747 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM747 precursor RNA is designated SEQ ID:724, and is provided hereinbelow with reference to the sequence listing part.

[10329] GAM747 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM747 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10330] An enzyme complex designated DICER COMPLEX, dices the GAM747 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM747 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM747 RNA is designated SEQ ID:3326, and is provided

hereinbelow with reference to the sequence listing part.

[10331] GAM747 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM747 target RNA, herein designated GAM TARGET RNA. GAM747 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10332] GAM747 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM747 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM747 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM747 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM747 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10333] The complementary binding of GAM747 RNA, herein designated GAM RNA, to target binding sites on GAM747 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM747 target RNA, herein designated GAM TARGET RNA, into GAM747 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10334] It is appreciated that GAM747 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM747 target genes. The mRNA of each one of this plurality of GAM747 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM747 RNA, herein designated GAM RNA, and which when bound by GAM747 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM747 target proteins.

[10335] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM747 gene, herein designated GAM GENE, on one or more GAM747 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10336] It is yet further appreciated that specific functions, and accordingly utilities, of GAM747 correlate with, and may be deduced from, the identity of the target genes which GAM747 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10337] Nucleotide sequences of the GAM747 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM747 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM747 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM747 are further described hereinbelow with reference to Table 1.

[10338] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM747 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10339] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 748 (GAM748) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10340] GAM748 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM748 was detected is

described hereinabove with reference to Figs. 2-8.

[10341] GAM748 gene, herein designated GAM GENE, and GAM748 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10342] GAM748 gene, herein designated GAM GENE, encodes a GAM748 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM748 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM748 precursor RNA is designated SEQ ID:725, and is provided hereinbelow with reference to the sequence listing part.

[10343] GAM748 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM748 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10344] An enzyme complex designated DICER COMPLEX, dices the GAM748 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM748 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM748 RNA is designated SEQ ID:3327, and is provided hereinbelow with reference to the sequence listing part.

[10345] GAM748 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM748 target RNA, herein designated GAM TARGET RNA. GAM748 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10346] GAM748 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM748 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM748 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM748 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM748 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10347] The complementary binding of GAM748 RNA, herein designated GAM RNA, to target binding sites on GAM748 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM748 target RNA, herein designated GAM TARGET RNA, into GAM748 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10348] It is appreciated that GAM748 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM748 target genes. The mRNA of each one of this plurality of GAM748 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM748 RNA, herein designated GAM RNA, and which when bound by GAM748 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM748 target proteins.

[10349] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM748 gene, herein designated GAM GENE, on one or more GAM748 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10350] It is yet further appreciated that specific functions, and accordingly utilities, of GAM748 correlate with, and may be deduced from, the identity of the target genes which GAM748 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10351] Nucleotide sequences of the GAM748 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM748 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM748 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM748 are further described hereinbelow with reference to Table 1.

[10352] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM748 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10353] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 749 (GAM749) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10354] GAM749 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM749 was detected is described hereinabove with reference to Figs. 2-8.

[10355] GAM749 gene, herein designated GAM GENE, and GAM749 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10356] GAM749 gene, herein designated GAM GENE, encodes a GAM749 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM749 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM749 precursor RNA is designated SEQ ID:726, and is provided hereinbelow with reference to the sequence listing part.

[10357] GAM749 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM749 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10358] An enzyme complex designated DICER COMPLEX, dices the GAM749 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM749 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM749 RNA is designated SEQ ID:3328, and is provided hereinbelow with reference to the sequence listing part.

[10359] GAM749 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM749 target RNA, herein designated GAM TARGET RNA. GAM749 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10360] GAM749 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM749 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM749 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM749 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM749 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10361] The complementary binding of GAM749 RNA, herein designated GAM RNA, to target binding sites on GAM749 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM749 target RNA, herein designated GAM TARGET RNA, into GAM749 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10362] It is appreciated that GAM749 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM749 target genes. The mRNA of each one of this plurality of GAM749 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM749 RNA, herein designated GAM RNA, and which when bound by GAM749 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM749 target proteins.

[10363] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM749 gene, herein designated GAM GENE, on one or more GAM749 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10364] It is yet further appreciated that specific functions, and accordingly utilities, of GAM749 correlate with, and may be deduced from, the identity of the target genes which GAM749 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10365] Nucleotide sequences of the GAM749 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM749 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM749 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM749 are further described hereinbelow with reference to Table 1.

[10366] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM749 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10367] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 750 (GAM750) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10368] GAM750 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM750 was detected is described hereinabove with reference to Figs. 2-8.

[10369] GAM750 gene, herein designated GAM GENE, and GAM750 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10370] GAM750 gene, herein designated GAM GENE, encodes a GAM750 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM750 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM750 precursor RNA is designated SEQ ID:727, and is provided hereinbelow with reference to the sequence listing part.

[10371] GAM750 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM750 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10372] An enzyme complex designated DICER COMPLEX, dices the GAM750 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM750 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of GAM750 RNA is designated SEQ ID:3330, and is provided hereinbelow with reference to the sequence listing part.

[10373] GAM750 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM750 target RNA, herein designated GAM TARGET RNA. GAM750 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10374] GAM750 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM750 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM750 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM750 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM750 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10375] The complementary binding of GAM750 RNA, herein designated GAM RNA, to target binding sites on GAM750 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM750 target RNA, herein designated GAM TARGET RNA, into GAM750 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10376] It is appreciated that GAM750 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM750 target genes. The mRNA of each one of this plurality of GAM750 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM750 RNA, herein designated GAM RNA, and which when bound by GAM750 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM750 target proteins.

[10377] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM750 gene, herein designated GAM GENE, on one or more

GAM750 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10378] It is yet further appreciated that specific functions, and accordingly utilities, of GAM750 correlate with, and may be deduced from, the identity of the target genes which GAM750 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10379] Nucleotide sequences of the GAM750 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM750 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM750 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM750 are further described hereinbelow with reference to Table 1.

[10380] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM750 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10381] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 751 (GAM751) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10382] GAM751 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM751 was detected is described hereinabove with reference to Figs. 2-8.

[10383] GAM751 gene, herein designated GAM GENE, and GAM751 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10384] GAM751 gene, herein designated GAM GENE, encodes a GAM751 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM751 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM751 precursor RNA is designated SEQ ID:728, and is provided hereinbelow with reference to the sequence listing part.

[10385] GAM751 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM751 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10386] An enzyme complex designated DICER COMPLEX, dices the GAM751 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM751 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM751 RNA is designated SEQ ID:3329, and is provided hereinbelow with reference to the sequence listing part.

[10387] GAM751 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM751 target RNA, herein designated GAM TARGET RNA. GAM751 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10388] GAM751 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM751 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM751 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM751 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM751 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10389] The complementary binding of GAM751 RNA, herein designated GAM RNA, to target binding sites on GAM751 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM751 target RNA, herein designated GAM TARGET RNA, into GAM751 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10390] It is appreciated that GAM751 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM751 target genes. The mRNA of each one of this plurality of GAM751 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM751 RNA, herein designated GAM RNA, and which when bound by GAM751 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM751 target proteins.

[10391] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM751 gene, herein designated GAM GENE, on one or more GAM751 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10392] It is yet further appreciated that specific functions, and accordingly utilities, of GAM751 correlate with, and may be deduced from, the identity of the target genes which GAM751 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10393] Nucleotide sequences of the GAM751 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM751 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM751 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM751 are further described hereinbelow with reference to Table 1.

[10394] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM751 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10395] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 752 (GAM752) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10396] GAM752 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM752 was detected is described hereinabove with reference to Figs. 2-8.

[10397] GAM752 gene, herein designated GAM GENE, and GAM752 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10398] GAM752 gene, herein designated GAM GENE, encodes a GAM752 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM752 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM752 precursor RNA is designated SEQ ID:729, and is provided hereinbelow with reference to the sequence listing part.

[10399] GAM752 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM752 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10400] An enzyme complex designated DICER COMPLEX, dices the GAM752 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM752 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM752 RNA is designated SEQ ID:3331, and is provided hereinbelow with reference to the sequence listing part.

[10401] GAM752 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM752 target RNA, herein designated GAM TARGET RNA. GAM752 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10402] GAM752 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM752

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM752 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM752 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM752 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10403] The complementary binding of GAM752 RNA, herein designated GAM RNA, to target binding sites on GAM752 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM752 target RNA, herein designated GAM TARGET RNA, into GAM752 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10404] It is appreciated that GAM752 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM752 target genes. The mRNA of each one of this plurality of GAM752 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM752 RNA, herein designated GAM RNA, and which when bound by GAM752 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM752 target proteins.

[10405] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM752 gene, herein designated GAM GENE, on one or more GAM752 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10406] It is yet further appreciated that specific functions, and accordingly utilities, of GAM752 correlate with, and may be deduced from, the identity of the target genes which GAM752 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10407] Nucleotide sequences of the GAM752 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM752 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM752 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM752 are further described hereinbelow with

reference to Table 1.

[10408] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM752 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10409] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 753 (GAM753) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10410] GAM753 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM753 was detected is described hereinabove with reference to Figs. 2-8.

[10411] GAM753 gene, herein designated GAM GENE, and GAM753 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10412] GAM753 gene, herein designated GAM GENE, encodes a GAM753 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM753 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM753 precursor RNA is designated SEQ ID:730, and is provided

hereinbelow with reference to the sequence listing part.

[10413] GAM753 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM753 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10414] An enzyme complex designated DICER COMPLEX, dices the GAM753 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM753 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 94%) nucleotide sequence of GAM753 RNA is designated SEQ ID:3332, and is provided hereinbelow with reference to the sequence listing part.

[10415] GAM753 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM753 target RNA, herein designated GAM TARGET RNA. GAM753 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[10416] GAM753 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM753 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM753 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM753 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM753 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10417] The complementary binding of GAM753 RNA, herein designated GAM RNA, to target binding sites on GAM753 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM753 target RNA, herein designated GAM TARGET RNA, into GAM753 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10418] It is appreciated that GAM753 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM753 target genes. The mRNA of each one of this plurality of GAM753 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM753 RNA, herein designated GAM RNA, and which when bound by GAM753 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM753 target proteins.

[10419] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM753 gene, herein designated GAM GENE, on one or more GAM753 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10420] It is yet further appreciated that specific functions, and accordingly utilities, of GAM753 correlate with, and may be deduced from, the identity of the target genes which GAM753 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10421] Nucleotide sequences of the GAM753 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM753 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM753 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM753 are further described hereinbelow with reference to Table 1.

[10422] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM753 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10423] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 754 (GAM754) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10424] GAM754 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM754 was detected is described hereinabove with reference to Figs. 2-8.

[10425] GAM754 gene, herein designated GAM GENE, and GAM754 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10426] GAM754 gene, herein designated GAM GENE, encodes a GAM754 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM754 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM754 precursor RNA is designated SEQ ID:731, and is provided hereinbelow with reference to the sequence listing part.

[10427] GAM754 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM754 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10428] An enzyme complex designated DICER COMPLEX, dices the GAM754 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM754 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM754 RNA is designated SEQ ID:3333, and is provided hereinbelow with reference to the sequence listing part.

[10429] GAM754 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM754 target RNA, herein designated

GAM TARGET RNA. GAM754 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10430] GAM754 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM754 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM754 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM754 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM754 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10431] The complementary binding of GAM754 RNA, herein designated GAM RNA, to target binding sites on GAM754 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM754 target RNA, herein designated GAM

TARGET RNA, into GAM754 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10432] It is appreciated that GAM754 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM754 target genes. The mRNA of each one of this plurality of GAM754 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM754 RNA, herein designated GAM RNA, and which when bound by GAM754 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM754 target proteins.

[10433] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM754 gene, herein designated GAM GENE, on one or more GAM754 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10434] It is yet further appreciated that specific functions, and accordingly utilities, of GAM754 correlate with, and may be deduced from, the identity of the target

genes which GAM754 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10435] Nucleotide sequences of the GAM754 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM754 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM754 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM754 are further described hereinbelow with reference to Table 1.

[10436] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM754 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10437] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 755 (GAM755) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10438] GAM755 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM755 was detected is described hereinabove with reference to Figs. 2-8.

[10439] GAM755 gene, herein designated GAM GENE, and GAM755 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[10440] GAM755 gene, herein designated GAM GENE, encodes a GAM755 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM755 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM755 precursor RNA is designated SEQ ID:732, and is provided hereinbelow with reference to the sequence listing part.

[10441] GAM755 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM755 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10442] An enzyme complex designated DICER COMPLEX, dices the GAM755 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM755 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM755 RNA is designated SEQ ID:3335, and is provided

hereinbelow with reference to the sequence listing part.

[10443] GAM755 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM755 target RNA, herein designated GAM TARGET RNA. GAM755 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10444] GAM755 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM755 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM755 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM755 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM755 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10445] The complementary binding of GAM755 RNA, herein designated GAM RNA, to target binding sites on GAM755 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM755 target RNA, herein designated GAM TARGET RNA, into GAM755 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10446] It is appreciated that GAM755 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM755 target genes. The mRNA of each one of this plurality of GAM755 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM755 RNA, herein designated GAM RNA, and which when bound by GAM755 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM755 target proteins.

[10447] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM755 gene, herein designated GAM GENE, on one or more GAM755 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10448] It is yet further appreciated that specific functions, and accordingly utilities, of GAM755 correlate with, and may be deduced from, the identity of the target genes which GAM755 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10449] Nucleotide sequences of the GAM755 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM755 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM755 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM755 are further described hereinbelow with reference to Table 1.

[10450] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM755 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10451] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 756 (GAM756) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10452] GAM756 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM756 was detected is

described hereinabove with reference to Figs. 2-8.

[10453] GAM756 gene, herein designated GAM GENE, and GAM756 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10454] GAM756 gene, herein designated GAM GENE, encodes a GAM756 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM756 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM756 precursor RNA is designated SEQ ID:733, and is provided hereinbelow with reference to the sequence listing part.

[10455] GAM756 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM756 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10456] An enzyme complex designated DICER COMPLEX, dices the GAM756 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM756 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM756 RNA is designated SEQ ID:3334, and is provided hereinbelow with reference to the sequence listing part.

[10457] GAM756 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM756 target RNA, herein designated GAM TARGET RNA. GAM756 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10458] GAM756 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM756 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM756 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM756 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM756 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10459] The complementary binding of GAM756 RNA, herein designated GAM RNA, to target binding sites on GAM756 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM756 target RNA, herein designated GAM TARGET RNA, into GAM756 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10460] It is appreciated that GAM756 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM756 target genes. The mRNA of each one of this plurality of GAM756 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM756 RNA, herein designated GAM RNA, and which when bound by GAM756 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM756 target proteins.

[10461] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM756 gene, herein designated GAM GENE, on one or more GAM756 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10462] It is yet further appreciated that specific functions, and accordingly utilities, of GAM756 correlate with, and may be deduced from, the identity of the target genes which GAM756 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10463] Nucleotide sequences of the GAM756 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM756 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM756 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM756 are further described hereinbelow with reference to Table 1.

[10464] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM756 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10465] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 757 (GAM757) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10466] GAM757 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM757 was detected is described hereinabove with reference to Figs. 2-8.

[10467] GAM757 gene, herein designated GAM GENE, and GAM757 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10468] GAM757 gene, herein designated GAM GENE, encodes a GAM757 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM757 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM757 precursor RNA is designated SEQ ID:734, and is provided hereinbelow with reference to the sequence listing part.

[10469] GAM757 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM757 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10470] An enzyme complex designated DICER COMPLEX, dices the GAM757 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM757 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM757 RNA is designated SEQ ID:3336, and is provided hereinbelow with reference to the sequence listing part.

[10471] GAM757 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM757 target RNA, herein designated GAM TARGET RNA. GAM757 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10472] GAM757 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM757 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM757 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM757 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM757 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10473] The complementary binding of GAM757 RNA, herein designated GAM RNA, to target binding sites on GAM757 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM757 target RNA, herein designated GAM TARGET RNA, into GAM757 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10474] It is appreciated that GAM757 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM757 target genes. The mRNA of each one of this plurality of GAM757 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM757 RNA, herein designated GAM RNA, and which when bound by GAM757 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM757 target proteins.

[10475] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM757 gene, herein designated GAM GENE, on one or more GAM757 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10476] It is yet further appreciated that specific functions, and accordingly utilities, of GAM757 correlate with, and may be deduced from, the identity of the target genes which GAM757 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10477] Nucleotide sequences of the GAM757 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM757 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM757 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM757 are further described hereinbelow with reference to Table 1.

[10478] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM757 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10479] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 758 (GAM758) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10480] GAM758 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM758 was detected is described hereinabove with reference to Figs. 2-8.

[10481] GAM758 gene, herein designated GAM GENE, and GAM758 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10482] GAM758 gene, herein designated GAM GENE, encodes a GAM758 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM758 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM758 precursor RNA is designated SEQ ID:735, and is provided hereinbelow with reference to the sequence listing part.

[10483] GAM758 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM758 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10484] An enzyme complex designated DICER COMPLEX, dices the GAM758 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM758 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM758 RNA is designated SEQ ID:3337, and is provided hereinbelow with reference to the sequence listing part.

[10485] GAM758 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM758 target RNA, herein designated GAM TARGET RNA. GAM758 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10486] GAM758 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM758 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM758 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM758 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM758 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10487] The complementary binding of GAM758 RNA, herein designated GAM RNA, to target binding sites on GAM758 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM758 target RNA, herein designated GAM TARGET RNA, into GAM758 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10488] It is appreciated that GAM758 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM758 target genes. The mRNA of each one of this plurality of GAM758 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM758 RNA, herein designated GAM RNA, and which when bound by GAM758 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM758 target proteins.

[10489] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM758 gene, herein designated GAM GENE, on one or more

GAM758 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10490] It is yet further appreciated that specific functions, and accordingly utilities, of GAM758 correlate with, and may be deduced from, the identity of the target genes which GAM758 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10491] Nucleotide sequences of the GAM758 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM758 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM758 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM758 are further described hereinbelow with reference to Table 1.

[10492] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM758 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10493] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 759 (GAM759) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10494] GAM759 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM759 was detected is described hereinabove with reference to Figs. 2-8.

[10495] GAM759 gene, herein designated GAM GENE, and GAM759 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10496] GAM759 gene, herein designated GAM GENE, encodes a GAM759 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM759 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM759 precursor RNA is designated SEQ ID:736, and is provided hereinbelow with reference to the sequence listing part.

[10497] GAM759 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM759 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10498] An enzyme complex designated DICER COMPLEX, dices the GAM759 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM759 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM759 RNA is designated SEQ ID:3338, and is provided hereinbelow with reference to the sequence listing part.

[10499] GAM759 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM759 target RNA, herein designated GAM TARGET RNA. GAM759 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10500] GAM759 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM759 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM759 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM759 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM759 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10501] The complementary binding of GAM759 RNA, herein designated GAM RNA, to target binding sites on GAM759 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM759 target RNA, herein designated GAM TARGET RNA, into GAM759 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10502] It is appreciated that GAM759 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM759 target genes. The mRNA of each one of this plurality of GAM759 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM759 RNA, herein designated GAM RNA, and which when bound by GAM759 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM759 target proteins.

[10503] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM759 gene, herein designated GAM GENE, on one or more GAM759 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10504] It is yet further appreciated that specific functions, and accordingly utilities, of GAM759 correlate with, and may be deduced from, the identity of the target genes which GAM759 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10505] Nucleotide sequences of the GAM759 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM759 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM759 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM759 are further described hereinbelow with reference to Table 1.

[10506] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM759 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10507] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 760 (GAM760) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10508] GAM760 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM760 was detected is described hereinabove with reference to Figs. 2-8.

[10509] GAM760 gene, herein designated GAM GENE, and GAM760 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10510] GAM760 gene, herein designated GAM GENE, encodes a GAM760 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM760 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM760 precursor RNA is designated SEQ ID:737, and is provided hereinbelow with reference to the sequence listing part.

[10511] GAM760 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM760 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10512] An enzyme complex designated DICER COMPLEX, dices the GAM760 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM760 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM760 RNA is designated SEQ ID:3339, and is provided hereinbelow with reference to the sequence listing part.

[10513] GAM760 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM760 target RNA, herein designated GAM TARGET RNA. GAM760 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10514] GAM760 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM760

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM760 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM760 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM760 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10515] The complementary binding of GAM760 RNA, herein designated GAM RNA, to target binding sites on GAM760 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM760 target RNA, herein designated GAM TARGET RNA, into GAM760 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10516] It is appreciated that GAM760 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM760 target genes. The mRNA of each one of this plurality of GAM760 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM760 RNA, herein designated GAM RNA, and which when bound by GAM760 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM760 target proteins.

[10517] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM760 gene, herein designated GAM GENE, on one or more GAM760 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10518] It is yet further appreciated that specific functions, and accordingly utilities, of GAM760 correlate with, and may be deduced from, the identity of the target genes which GAM760 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10519] Nucleotide sequences of the GAM760 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM760 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM760 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM760 are further described hereinbelow with

reference to Table 1.

[10520] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM760 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10521] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 761 (GAM761) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10522] GAM761 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM761 was detected is described hereinabove with reference to Figs. 2-8.

[10523] GAM761 gene, herein designated GAM GENE, and GAM761 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10524] GAM761 gene, herein designated GAM GENE, encodes a GAM761 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM761 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM761 precursor RNA is designated SEQ ID:738, and is provided

hereinbelow with reference to the sequence listing part.

[10525] GAM761 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM761 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10526] An enzyme complex designated DICER COMPLEX, dices the GAM761 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM761 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM761 RNA is designated SEQ ID:3340, and is provided hereinbelow with reference to the sequence listing part.

[10527] GAM761 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM761 target RNA, herein designated GAM TARGET RNA. GAM761 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[10528] GAM761 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM761 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM761 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM761 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM761 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10529] The complementary binding of GAM761 RNA, herein designated GAM RNA, to target binding sites on GAM761 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM761 target RNA, herein designated GAM TARGET RNA, into GAM761 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10530] It is appreciated that GAM761 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM761 target genes. The mRNA of each one of this plurality of GAM761 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM761 RNA, herein designated GAM RNA, and which when bound by GAM761 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM761 target proteins.

[10531] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM761 gene, herein designated GAM GENE, on one or more GAM761 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10532] It is yet further appreciated that specific functions, and accordingly utilities, of GAM761 correlate with, and may be deduced from, the identity of the target genes which GAM761 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10533] Nucleotide sequences of the GAM761 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM761 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM761 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM761 are further described hereinbelow with reference to Table 1.

[10534] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM761 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10535] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 762 (GAM762) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10536] GAM762 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM762 was detected is described hereinabove with reference to Figs. 2-8.

[10537] GAM762 gene, herein designated GAM GENE, and GAM762 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10538] GAM762 gene, herein designated GAM GENE, encodes a GAM762 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM762 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM762 precursor RNA is designated SEQ ID:739, and is provided hereinbelow with reference to the sequence listing part.

[10539] GAM762 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM762 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10540] An enzyme complex designated DICER COMPLEX, dices the GAM762 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM762 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM762 RNA is designated SEQ ID:3341, and is provided hereinbelow with reference to the sequence listing part.

[10541] GAM762 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM762 target RNA, herein designated

GAM TARGET RNA. GAM762 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10542] GAM762 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM762 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM762 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM762 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM762 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10543] The complementary binding of GAM762 RNA, herein designated GAM RNA, to target binding sites on GAM762 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM762 target RNA, herein designated GAM

TARGET RNA, into GAM762 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10544] It is appreciated that GAM762 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM762 target genes. The mRNA of each one of this plurality of GAM762 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM762 RNA, herein designated GAM RNA, and which when bound by GAM762 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM762 target proteins.

[10545] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM762 gene, herein designated GAM GENE, on one or more GAM762 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10546] It is yet further appreciated that specific functions, and accordingly utilities, of GAM762 correlate with, and may be deduced from, the identity of the target

genes which GAM762 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10547] Nucleotide sequences of the GAM762 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM762 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM762 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM762 are further described hereinbelow with reference to Table 1.

[10548] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM762 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10549] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 763 (GAM763) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10550] GAM763 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM763 was detected is described hereinabove with reference to Figs. 2-8.

[10551] GAM763 gene, herein designated GAM GENE, and GAM763 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[10552] GAM763 gene, herein designated GAM GENE, encodes a GAM763 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM763 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM763 precursor RNA is designated SEQ ID:740, and is provided hereinbelow with reference to the sequence listing part.

[10553] GAM763 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM763 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10554] An enzyme complex designated DICER COMPLEX, dices the GAM763 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM763 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM763 RNA is designated SEQ ID:3343, and is provided

hereinbelow with reference to the sequence listing part.

[10555] GAM763 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM763 target RNA, herein designated GAM TARGET RNA. GAM763 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10556] GAM763 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM763 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM763 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM763 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM763 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10557] The complementary binding of GAM763 RNA, herein designated GAM RNA, to target binding sites on GAM763 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM763 target RNA, herein designated GAM TARGET RNA, into GAM763 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10558] It is appreciated that GAM763 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM763 target genes. The mRNA of each one of this plurality of GAM763 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM763 RNA, herein designated GAM RNA, and which when bound by GAM763 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM763 target proteins.

[10559] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM763 gene, herein designated GAM GENE, on one or more GAM763 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10560] It is yet further appreciated that specific functions, and accordingly utilities, of GAM763 correlate with, and may be deduced from, the identity of the target genes which GAM763 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10561] Nucleotide sequences of the GAM763 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM763 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM763 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM763 are further described hereinbelow with reference to Table 1.

[10562] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM763 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10563] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 764 (GAM764) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10564] GAM764 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM764 was detected is

described hereinabove with reference to Figs. 2-8.

[10565] GAM764 gene, herein designated GAM GENE, and GAM764 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10566] GAM764 gene, herein designated GAM GENE, encodes a GAM764 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM764 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM764 precursor RNA is designated SEQ ID:741, and is provided hereinbelow with reference to the sequence listing part.

[10567] GAM764 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM764 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10568] An enzyme complex designated DICER COMPLEX, dices the GAM764 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM764 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM764 RNA is designated SEQ ID:3342, and is provided hereinbelow with reference to the sequence listing part.

[10569] GAM764 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM764 target RNA, herein designated GAM TARGET RNA. GAM764 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10570] GAM764 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM764 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM764 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM764 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM764 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10571] The complementary binding of GAM764 RNA, herein designated GAM RNA, to target binding sites on GAM764 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM764 target RNA, herein designated GAM TARGET RNA, into GAM764 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10572] It is appreciated that GAM764 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM764 target genes. The mRNA of each one of this plurality of GAM764 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM764 RNA, herein designated GAM RNA, and which when bound by GAM764 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM764 target proteins.

[10573] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM764 gene, herein designated GAM GENE, on one or more GAM764 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10574] It is yet further appreciated that specific functions, and accordingly utilities, of GAM764 correlate with, and may be deduced from, the identity of the target genes which GAM764 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10575] Nucleotide sequences of the GAM764 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM764 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM764 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM764 are further described hereinbelow with reference to Table 1.

[10576] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM764 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10577] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 765 (GAM765) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10578] GAM765 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM765 was detected is described hereinabove with reference to Figs. 2-8.

[10579] GAM765 gene, herein designated GAM GENE, and GAM765 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10580] GAM765 gene, herein designated GAM GENE, encodes a GAM765 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM765 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM765 precursor RNA is designated SEQ ID:742, and is provided hereinbelow with reference to the sequence listing part.

[10581] GAM765 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM765 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10582] An enzyme complex designated DICER COMPLEX, dices the GAM765 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM765 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM765 RNA is designated SEQ ID:3344, and is provided hereinbelow with reference to the sequence listing part.

[10583] GAM765 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM765 target RNA, herein designated GAM TARGET RNA. GAM765 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10584] GAM765 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM765 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM765 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM765 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM765 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10585] The complementary binding of GAM765 RNA, herein designated GAM RNA, to target binding sites on GAM765 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM765 target RNA, herein designated GAM TARGET RNA, into GAM765 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10586] It is appreciated that GAM765 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM765 target genes. The mRNA of each one of this plurality of GAM765 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM765 RNA, herein designated GAM RNA, and which when bound by GAM765 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM765 target proteins.

[10587] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM765 gene, herein designated GAM GENE, on one or more GAM765 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10588] It is yet further appreciated that specific functions, and accordingly utilities, of GAM765 correlate with, and may be deduced from, the identity of the target genes which GAM765 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10589] Nucleotide sequences of the GAM765 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM765 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM765 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM765 are further described hereinbelow with reference to Table 1.

[10590] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM765 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10591] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 766 (GAM766) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10592] GAM766 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM766 was detected is described hereinabove with reference to Figs. 2-8.

[10593] GAM766 gene, herein designated GAM GENE, and GAM766 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10594] GAM766 gene, herein designated GAM GENE, encodes a GAM766 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM766 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM766 precursor RNA is designated SEQ ID:743, and is provided hereinbelow with reference to the sequence listing part.

[10595] GAM766 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM766 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10596] An enzyme complex designated DICER COMPLEX, dices the GAM766 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM766 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM766 RNA is designated SEQ ID:3346, and is provided hereinbelow with reference to the sequence listing part.

[10597] GAM766 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM766 target RNA, herein designated GAM TARGET RNA. GAM766 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10598] GAM766 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM766 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM766 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM766 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM766 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10599] The complementary binding of GAM766 RNA, herein designated GAM RNA, to target binding sites on GAM766 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM766 target RNA, herein designated GAM TARGET RNA, into GAM766 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10600] It is appreciated that GAM766 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM766 target genes. The mRNA of each one of this plurality of GAM766 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM766 RNA, herein designated GAM RNA, and which when bound by GAM766 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM766 target proteins.

[10601] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM766 gene, herein designated GAM GENE, on one or more

GAM766 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10602] It is yet further appreciated that specific functions, and accordingly utilities, of GAM766 correlate with, and may be deduced from, the identity of the target genes which GAM766 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10603] Nucleotide sequences of the GAM766 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM766 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM766 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM766 are further described hereinbelow with reference to Table 1.

[10604] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM766 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10605] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 767 (GAM767) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10606] GAM767 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM767 was detected is described hereinabove with reference to Figs. 2-8.

[10607] GAM767 gene, herein designated GAM GENE, and GAM767 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10608] GAM767 gene, herein designated GAM GENE, encodes a GAM767 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM767 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM767 precursor RNA is designated SEQ ID:744, and is provided hereinbelow with reference to the sequence listing part.

[10609] GAM767 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM767 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10610] An enzyme complex designated DICER COMPLEX, dices the GAM767 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM767 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM767 RNA is designated SEQ ID:3347, and is provided hereinbelow with reference to the sequence listing part.

[10611] GAM767 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM767 target RNA, herein designated GAM TARGET RNA. GAM767 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10612] GAM767 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM767 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM767 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM767 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM767 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10613] The complementary binding of GAM767 RNA, herein designated GAM RNA, to target binding sites on GAM767 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM767 target RNA, herein designated GAM TARGET RNA, into GAM767 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10614] It is appreciated that GAM767 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM767 target genes. The mRNA of each one of this plurality of GAM767 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM767 RNA, herein designated GAM RNA, and which when bound by GAM767 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM767 target proteins.

[10615] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM767 gene, herein designated GAM GENE, on one or more GAM767 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10616] It is yet further appreciated that specific functions, and accordingly utilities, of GAM767 correlate with, and may be deduced from, the identity of the target genes which GAM767 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10617] Nucleotide sequences of the GAM767 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM767 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM767 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM767 are further described hereinbelow with reference to Table 1.

[10618] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM767 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10619] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 768 (GAM768) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10620] GAM768 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM768 was detected is described hereinabove with reference to Figs. 2-8.

[10621] GAM768 gene, herein designated GAM GENE, and GAM768 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10622] GAM768 gene, herein designated GAM GENE, encodes a GAM768 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM768 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM768 precursor RNA is designated SEQ ID:745, and is provided hereinbelow with reference to the sequence listing part.

[10623] GAM768 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM768 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10624] An enzyme complex designated DICER COMPLEX, dices the GAM768 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM768 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM768 RNA is designated SEQ ID:3345, and is provided hereinbelow with reference to the sequence listing part.

[10625] GAM768 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM768 target RNA, herein designated GAM TARGET RNA. GAM768 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10626] GAM768 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM768

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM768 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM768 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM768 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10627] The complementary binding of GAM768 RNA, herein designated GAM RNA, to target binding sites on GAM768 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM768 target RNA, herein designated GAM TARGET RNA, into GAM768 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10628] It is appreciated that GAM768 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM768 target genes. The mRNA of each one of this plurality of GAM768 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM768 RNA, herein designated GAM RNA, and which when bound by GAM768 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM768 target proteins.

[10629] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM768 gene, herein designated GAM GENE, on one or more GAM768 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10630] It is yet further appreciated that specific functions, and accordingly utilities, of GAM768 correlate with, and may be deduced from, the identity of the target genes which GAM768 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10631] Nucleotide sequences of the GAM768 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM768 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM768 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM768 are further described hereinbelow with

reference to Table 1.

[10632] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM768 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10633] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 769 (GAM769) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10634] GAM769 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM769 was detected is described hereinabove with reference to Figs. 2-8.

[10635] GAM769 gene, herein designated GAM GENE, and GAM769 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10636] GAM769 gene, herein designated GAM GENE, encodes a GAM769 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM769 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM769 precursor RNA is designated SEQ ID:746, and is provided

hereinbelow with reference to the sequence listing part.

[10637] GAM769 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM769 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10638] An enzyme complex designated DICER COMPLEX, dices the GAM769 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM769 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM769 RNA is designated SEQ ID:3348, and is provided hereinbelow with reference to the sequence listing part.

[10639] GAM769 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM769 target RNA, herein designated GAM TARGET RNA. GAM769 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[10640] GAM769 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM769 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM769 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM769 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM769 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10641] The complementary binding of GAM769 RNA, herein designated GAM RNA, to target binding sites on GAM769 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM769 target RNA, herein designated GAM TARGET RNA, into GAM769 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10642] It is appreciated that GAM769 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM769 target genes. The mRNA of each one of this plurality of GAM769 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM769 RNA, herein designated GAM RNA, and which when bound by GAM769 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM769 target proteins.

[10643] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM769 gene, herein designated GAM GENE, on one or more GAM769 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10644] It is yet further appreciated that specific functions, and accordingly utilities, of GAM769 correlate with, and may be deduced from, the identity of the target genes which GAM769 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10645] Nucleotide sequences of the GAM769 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM769 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM769 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM769 are further described hereinbelow with reference to Table 1.

[10646] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM769 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10647] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 770 (GAM770) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10648] GAM770 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM770 was detected is described hereinabove with reference to Figs. 2-8.

[10649] GAM770 gene, herein designated GAM GENE, and GAM770 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10650] GAM770 gene, herein designated GAM GENE, encodes a GAM770 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM770 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM770 precursor RNA is designated SEQ ID:747, and is provided hereinbelow with reference to the sequence listing part.

[10651] GAM770 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10652] An enzyme complex designated DICER COMPLEX, dices the GAM770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM770 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM770 RNA is designated SEQ ID:3349, and is provided hereinbelow with reference to the sequence listing part.

[10653] GAM770 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM770 target RNA, herein designated

GAM TARGET RNA. GAM770 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10654] GAM770 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM770 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM770 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM770 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM770 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10655] The complementary binding of GAM770 RNA, herein designated GAM RNA, to target binding sites on GAM770 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM770 target RNA, herein designated GAM

TARGET RNA, into GAM770 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10656] It is appreciated that GAM770 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM770 target genes. The mRNA of each one of this plurality of GAM770 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM770 RNA, herein designated GAM RNA, and which when bound by GAM770 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM770 target proteins.

[10657] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM770 gene, herein designated GAM GENE, on one or more GAM770 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10658] It is yet further appreciated that specific functions, and accordingly utilities, of GAM770 correlate with, and may be deduced from, the identity of the target

genes which GAM770 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10659] Nucleotide sequences of the GAM770 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM770 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM770 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM770 are further described hereinbelow with reference to Table 1.

[10660] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM770 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10661] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 771 (GAM771) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10662] GAM771 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM771 was detected is described hereinabove with reference to Figs. 2-8.

[10663] GAM771 gene, herein designated GAM GENE, and GAM771 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[10664] GAM771 gene, herein designated GAM GENE, encodes a GAM771 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM771 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM771 precursor RNA is designated SEQ ID:748, and is provided hereinbelow with reference to the sequence listing part.

[10665] GAM771 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM771 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10666] An enzyme complex designated DICER COMPLEX, dices the GAM771 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM771 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM771 RNA is designated SEQ ID:3350, and is provided

hereinbelow with reference to the sequence listing part.

[10667] GAM771 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM771 target RNA, herein designated GAM TARGET RNA. GAM771 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10668] GAM771 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM771 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM771 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM771 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM771 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10669] The complementary binding of GAM771 RNA, herein designated GAM RNA, to target binding sites on GAM771 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM771 target RNA, herein designated GAM TARGET RNA, into GAM771 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10670] It is appreciated that GAM771 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM771 target genes. The mRNA of each one of this plurality of GAM771 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM771 RNA, herein designated GAM RNA, and which when bound by GAM771 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM771 target proteins.

[10671] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM771 gene, herein designated GAM GENE, on one or more GAM771 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10672] It is yet further appreciated that specific functions, and accordingly utilities, of GAM771 correlate with, and may be deduced from, the identity of the target genes which GAM771 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10673] Nucleotide sequences of the GAM771 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM771 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM771 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM771 are further described hereinbelow with reference to Table 1.

[10674] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM771 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10675] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 772 (GAM772) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10676] GAM772 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM772 was detected is

described hereinabove with reference to Figs. 2-8.

[10677] GAM772 gene, herein designated GAM GENE, and GAM772 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10678] GAM772 gene, herein designated GAM GENE, encodes a GAM772 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM772 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM772 precursor RNA is designated SEQ ID:749, and is provided hereinbelow with reference to the sequence listing part.

[10679] GAM772 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM772 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10680] An enzyme complex designated DICER COMPLEX, dices the GAM772 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM772 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM772 RNA is designated SEQ ID:3351, and is provided hereinbelow with reference to the sequence listing part.

[10681] GAM772 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM772 target RNA, herein designated GAM TARGET RNA. GAM772 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10682] GAM772 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM772 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM772 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM772 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM772 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10683] The complementary binding of GAM772 RNA, herein designated GAM RNA, to target binding sites on GAM772 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM772 target RNA, herein designated GAM TARGET RNA, into GAM772 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10684] It is appreciated that GAM772 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM772 target genes. The mRNA of each one of this plurality of GAM772 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM772 RNA, herein designated GAM RNA, and which when bound by GAM772 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM772 target proteins.

[10685] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM772 gene, herein designated GAM GENE, on one or more GAM772 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10686] It is yet further appreciated that specific functions, and accordingly utilities, of GAM772 correlate with, and may be deduced from, the identity of the target genes which GAM772 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10687] Nucleotide sequences of the GAM772 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM772 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM772 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM772 are further described hereinbelow with reference to Table 1.

[10688] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM772 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10689] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 773 (GAM773) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10690] GAM773 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM773 was detected is described hereinabove with reference to Figs. 2-8.

[10691] GAM773 gene, herein designated GAM GENE, and GAM773 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10692] GAM773 gene, herein designated GAM GENE, encodes a GAM773 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM773 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM773 precursor RNA is designated SEQ ID:750, and is provided hereinbelow with reference to the sequence listing part.

[10693] GAM773 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM773 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10694] An enzyme complex designated DICER COMPLEX, dices the GAM773 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM773 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM773 RNA is designated SEQ ID:3352, and is provided hereinbelow with reference to the sequence listing part.

[10695] GAM773 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM773 target RNA, herein designated GAM TARGET RNA. GAM773 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10696] GAM773 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM773 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM773 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM773 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM773 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10697] The complementary binding of GAM773 RNA, herein designated GAM RNA, to target binding sites on GAM773 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM773 target RNA, herein designated GAM TARGET RNA, into GAM773 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10698] It is appreciated that GAM773 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM773 target genes. The mRNA of each one of this plurality of GAM773 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM773 RNA, herein designated GAM RNA, and which when bound by GAM773 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM773 target proteins.

[10699] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM773 gene, herein designated GAM GENE, on one or more GAM773 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10700] It is yet further appreciated that specific functions, and accordingly utilities, of GAM773 correlate with, and may be deduced from, the identity of the target genes which GAM773 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10701] Nucleotide sequences of the GAM773 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM773 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM773 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM773 are further described hereinbelow with reference to Table 1.

[10702] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM773 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10703] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 774 (GAM774) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10704] GAM774 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM774 was detected is described hereinabove with reference to Figs. 2-8.

[10705] GAM774 gene, herein designated GAM GENE, and GAM774 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10706] GAM774 gene, herein designated GAM GENE, encodes a GAM774 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM774 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM774 precursor RNA is designated SEQ ID:751, and is provided hereinbelow with reference to the sequence listing part.

[10707] GAM774 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM774 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10708] An enzyme complex designated DICER COMPLEX, dices the GAM774 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM774 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM774 RNA is designated SEQ ID:3353, and is provided hereinbelow with reference to the sequence listing part.

[10709] GAM774 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM774 target RNA, herein designated GAM TARGET RNA. GAM774 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10710] GAM774 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM774 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM774 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM774 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM774 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10711] The complementary binding of GAM774 RNA, herein designated GAM RNA, to target binding sites on GAM774 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM774 target RNA, herein designated GAM TARGET RNA, into GAM774 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10712] It is appreciated that GAM774 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM774 target genes. The mRNA of each one of this plurality of GAM774 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM774 RNA, herein designated GAM RNA, and which when bound by GAM774 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM774 target proteins.

[10713] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM774 gene, herein designated GAM GENE, on one or more

GAM774 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10714] It is yet further appreciated that specific functions, and accordingly utilities, of GAM774 correlate with, and may be deduced from, the identity of the target genes which GAM774 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10715] Nucleotide sequences of the GAM774 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM774 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM774 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM774 are further described hereinbelow with reference to Table 1.

[10716] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM774 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10717] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 775 (GAM775) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10718] GAM775 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM775 was detected is described hereinabove with reference to Figs. 2-8.

[10719] GAM775 gene, herein designated GAM GENE, and GAM775 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10720] GAM775 gene, herein designated GAM GENE, encodes a GAM775 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM775 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM775 precursor RNA is designated SEQ ID:752, and is provided hereinbelow with reference to the sequence listing part.

[10721] GAM775 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM775 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10722] An enzyme complex designated DICER COMPLEX, dices the GAM775 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM775 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM775 RNA is designated SEQ ID:3354, and is provided hereinbelow with reference to the sequence listing part.

[10723] GAM775 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM775 target RNA, herein designated GAM TARGET RNA. GAM775 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10724] GAM775 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM775 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM775 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM775 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM775 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10725] The complementary binding of GAM775 RNA, herein designated GAM RNA, to target binding sites on GAM775 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM775 target RNA, herein designated GAM TARGET RNA, into GAM775 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10726] It is appreciated that GAM775 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM775 target genes. The mRNA of each one of this plurality of GAM775 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM775 RNA, herein designated GAM RNA, and which when bound by GAM775 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM775 target proteins.

[10727] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM775 gene, herein designated GAM GENE, on one or more GAM775 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10728] It is yet further appreciated that specific functions, and accordingly utilities, of GAM775 correlate with, and may be deduced from, the identity of the target genes which GAM775 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10729] Nucleotide sequences of the GAM775 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM775 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM775 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM775 are further described hereinbelow with reference to Table 1.

[10730] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM775 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10731] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 776 (GAM776) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10732] GAM776 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM776 was detected is described hereinabove with reference to Figs. 2-8.

[10733] GAM776 gene, herein designated GAM GENE, and GAM776 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10734] GAM776 gene, herein designated GAM GENE, encodes a GAM776 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM776 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM776 precursor RNA is designated SEQ ID:753, and is provided hereinbelow with reference to the sequence listing part.

[10735] GAM776 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM776 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10736] An enzyme complex designated DICER COMPLEX, dices the GAM776 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM776 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 94%) nucleotide sequence of GAM776 RNA is designated SEQ ID:3355, and is provided hereinbelow with reference to the sequence listing part.

[10737] GAM776 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM776 target RNA, herein designated GAM TARGET RNA. GAM776 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10738] GAM776 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM776

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM776 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM776 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM776 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10739] The complementary binding of GAM776 RNA, herein designated GAM RNA, to target binding sites on GAM776 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM776 target RNA, herein designated GAM TARGET RNA, into GAM776 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10740] It is appreciated that GAM776 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM776 target genes. The mRNA of each one of this plurality of GAM776 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM776 RNA, herein designated GAM RNA, and which when bound by GAM776 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM776 target proteins.

[10741] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM776 gene, herein designated GAM GENE, on one or more GAM776 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10742] It is yet further appreciated that specific functions, and accordingly utilities, of GAM776 correlate with, and may be deduced from, the identity of the target genes which GAM776 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10743] Nucleotide sequences of the GAM776 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM776 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM776 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM776 are further described hereinbelow with

reference to Table 1.

[10744] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM776 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10745] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 777 (GAM777) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10746] GAM777 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM777 was detected is described hereinabove with reference to Figs. 2-8.

[10747] GAM777 gene, herein designated GAM GENE, and GAM777 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10748] GAM777 gene, herein designated GAM GENE, encodes a GAM777 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM777 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM777 precursor RNA is designated SEQ ID:754, and is provided

hereinbelow with reference to the sequence listing part.

[10749] GAM777 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM777 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10750] An enzyme complex designated DICER COMPLEX, dices the GAM777 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM777 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM777 RNA is designated SEQ ID:3356, and is provided hereinbelow with reference to the sequence listing part.

[10751] GAM777 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM777 target RNA, herein designated GAM TARGET RNA. GAM777 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[10752] GAM777 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM777 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM777 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM777 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM777 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10753] The complementary binding of GAM777 RNA, herein designated GAM RNA, to target binding sites on GAM777 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM777 target RNA, herein designated GAM TARGET RNA, into GAM777 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10754] It is appreciated that GAM777 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM777 target genes. The mRNA of each one of this plurality of GAM777 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM777 RNA, herein designated GAM RNA, and which when bound by GAM777 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM777 target proteins.

[10755] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM777 gene, herein designated GAM GENE, on one or more GAM777 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10756] It is yet further appreciated that specific functions, and accordingly utilities, of GAM777 correlate with, and may be deduced from, the identity of the target genes which GAM777 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10757] Nucleotide sequences of the GAM777 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM777 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM777 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM777 are further described hereinbelow with reference to Table 1.

[10758] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM777 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10759] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 778 (GAM778) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10760] GAM778 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM778 was detected is described hereinabove with reference to Figs. 2-8.

[10761] GAM778 gene, herein designated GAM GENE, and GAM778 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10762] GAM778 gene, herein designated GAM GENE, encodes a GAM778 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM778 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM778 precursor RNA is designated SEQ ID:755, and is provided hereinbelow with reference to the sequence listing part.

[10763] GAM778 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM778 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10764] An enzyme complex designated DICER COMPLEX, dices the GAM778 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM778 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM778 RNA is designated SEQ ID:3357, and is provided hereinbelow with reference to the sequence listing part.

[10765] GAM778 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM778 target RNA, herein designated

GAM TARGET RNA. GAM778 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10766] GAM778 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM778 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM778 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM778 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM778 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10767] The complementary binding of GAM778 RNA, herein designated GAM RNA, to target binding sites on GAM778 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM778 target RNA, herein designated GAM

TARGET RNA, into GAM778 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10768] It is appreciated that GAM778 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM778 target genes. The mRNA of each one of this plurality of GAM778 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM778 RNA, herein designated GAM RNA, and which when bound by GAM778 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM778 target proteins.

[10769] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM778 gene, herein designated GAM GENE, on one or more GAM778 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10770] It is yet further appreciated that specific functions, and accordingly utilities, of GAM778 correlate with, and may be deduced from, the identity of the target

genes which GAM778 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10771] Nucleotide sequences of the GAM778 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM778 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM778 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM778 are further described hereinbelow with reference to Table 1.

[10772] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM778 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10773] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 779 (GAM779) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10774] GAM779 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM779 was detected is described hereinabove with reference to Figs. 2-8.

[10775] GAM779 gene, herein designated GAM GENE, and GAM779 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[10776] GAM779 gene, herein designated GAM GENE, encodes a GAM779 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM779 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM779 precursor RNA is designated SEQ ID:756, and is provided hereinbelow with reference to the sequence listing part.

[10777] GAM779 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM779 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10778] An enzyme complex designated DICER COMPLEX, dices the GAM779 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM779 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM779 RNA is designated SEQ ID:3358, and is provided

hereinbelow with reference to the sequence listing part.

[10779] GAM779 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM779 target RNA, herein designated GAM TARGET RNA. GAM779 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10780] GAM779 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM779 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM779 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM779 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM779 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10781] The complementary binding of GAM779 RNA, herein designated GAM RNA, to target binding sites on GAM779 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM779 target RNA, herein designated GAM TARGET RNA, into GAM779 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10782] It is appreciated that GAM779 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM779 target genes. The mRNA of each one of this plurality of GAM779 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM779 RNA, herein designated GAM RNA, and which when bound by GAM779 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM779 target proteins.

[10783] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM779 gene, herein designated GAM GENE, on one or more GAM779 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10784] It is yet further appreciated that specific functions, and accordingly utilities, of GAM779 correlate with, and may be deduced from, the identity of the target genes which GAM779 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10785] Nucleotide sequences of the GAM779 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM779 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM779 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM779 are further described hereinbelow with reference to Table 1.

[10786] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM779 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10787] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 780 (GAM780) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10788] GAM780 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM780 was detected is

described hereinabove with reference to Figs. 2-8.

[10789] GAM780 gene, herein designated GAM GENE, and GAM780 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10790] GAM780 gene, herein designated GAM GENE, encodes a GAM780 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM780 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM780 precursor RNA is designated SEQ ID:757, and is provided hereinbelow with reference to the sequence listing part.

[10791] GAM780 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM780 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10792] An enzyme complex designated DICER COMPLEX, dices the GAM780 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM780 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM780 RNA is designated SEQ ID:3359, and is provided hereinbelow with reference to the sequence listing part.

[10793] GAM780 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM780 target RNA, herein designated GAM TARGET RNA. GAM780 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10794] GAM780 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM780 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM780 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM780 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM780 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10795] The complementary binding of GAM780 RNA, herein designated GAM RNA, to target binding sites on GAM780 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM780 target RNA, herein designated GAM TARGET RNA, into GAM780 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10796] It is appreciated that GAM780 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM780 target genes. The mRNA of each one of this plurality of GAM780 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM780 RNA, herein designated GAM RNA, and which when bound by GAM780 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM780 target proteins.

[10797] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM780 gene, herein designated GAM GENE, on one or more GAM780 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10798] It is yet further appreciated that specific functions, and accordingly utilities, of GAM780 correlate with, and may be deduced from, the identity of the target genes which GAM780 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10799] Nucleotide sequences of the GAM780 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM780 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM780 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM780 are further described hereinbelow with reference to Table 1.

[10800] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM780 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10801] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 781 (GAM781) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10802] GAM781 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM781 was detected is described hereinabove with reference to Figs. 2-8.

[10803] GAM781 gene, herein designated GAM GENE, and GAM781 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10804] GAM781 gene, herein designated GAM GENE, encodes a GAM781 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM781 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM781 precursor RNA is designated SEQ ID:758, and is provided hereinbelow with reference to the sequence listing part.

[10805] GAM781 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM781 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10806] An enzyme complex designated DICER COMPLEX, dices the GAM781 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM781 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM781 RNA is designated SEQ ID:3360, and is provided hereinbelow with reference to the sequence listing part.

[10807] GAM781 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM781 target RNA, herein designated GAM TARGET RNA. GAM781 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10808] GAM781 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM781 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM781 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM781 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM781 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10809] The complementary binding of GAM781 RNA, herein designated GAM RNA, to target binding sites on GAM781 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM781 target RNA, herein designated GAM TARGET RNA, into GAM781 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10810] It is appreciated that GAM781 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM781 target genes. The mRNA of each one of this plurality of GAM781 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM781 RNA, herein designated GAM RNA, and which when bound by GAM781 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM781 target proteins.

[10811] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM781 gene, herein designated GAM GENE, on one or more GAM781 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10812] It is yet further appreciated that specific functions, and accordingly utilities, of GAM781 correlate with, and may be deduced from, the identity of the target genes which GAM781 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10813] Nucleotide sequences of the GAM781 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM781 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM781 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM781 are further described hereinbelow with reference to Table 1.

[10814] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM781 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10815] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 782 (GAM782) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10816] GAM782 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM782 was detected is described hereinabove with reference to Figs. 2-8.

[10817] GAM782 gene, herein designated GAM GENE, and GAM782 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10818] GAM782 gene, herein designated GAM GENE, encodes a GAM782 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM782 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM782 precursor RNA is designated SEQ ID:759, and is provided hereinbelow with reference to the sequence listing part.

[10819] GAM782 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM782 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10820] An enzyme complex designated DICER COMPLEX, dices the GAM782 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM782 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM782 RNA is designated SEQ ID:3361, and is provided hereinbelow with reference to the sequence listing part.

[10821] GAM782 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM782 target RNA, herein designated GAM TARGET RNA. GAM782 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10822] GAM782 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM782 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM782 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM782 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM782 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10823] The complementary binding of GAM782 RNA, herein designated GAM RNA, to target binding sites on GAM782 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM782 target RNA, herein designated GAM TARGET RNA, into GAM782 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10824] It is appreciated that GAM782 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM782 target genes. The mRNA of each one of this plurality of GAM782 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM782 RNA, herein designated GAM RNA, and which when bound by GAM782 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM782 target proteins.

[10825] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM782 gene, herein designated GAM GENE, on one or more

GAM782 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10826] It is yet further appreciated that specific functions, and accordingly utilities, of GAM782 correlate with, and may be deduced from, the identity of the target genes which GAM782 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10827] Nucleotide sequences of the GAM782 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM782 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM782 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM782 are further described hereinbelow with reference to Table 1.

[10828] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM782 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10829] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 783 (GAM783) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10830] GAM783 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM783 was detected is described hereinabove with reference to Figs. 2-8.

[10831] GAM783 gene, herein designated GAM GENE, and GAM783 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10832] GAM783 gene, herein designated GAM GENE, encodes a GAM783 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM783 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM783 precursor RNA is designated SEQ ID:760, and is provided hereinbelow with reference to the sequence listing part.

[10833] GAM783 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM783 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10834] An enzyme complex designated DICER COMPLEX, dices the GAM783 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM783 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM783 RNA is designated SEQ ID:3363, and is provided hereinbelow with reference to the sequence listing part.

[10835] GAM783 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM783 target RNA, herein designated GAM TARGET RNA. GAM783 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10836] GAM783 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM783 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM783 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM783 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM783 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10837] The complementary binding of GAM783 RNA, herein designated GAM RNA, to target binding sites on GAM783 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM783 target RNA, herein designated GAM TARGET RNA, into GAM783 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10838] It is appreciated that GAM783 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM783 target genes. The mRNA of each one of this plurality of GAM783 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM783 RNA, herein designated GAM RNA, and which when bound by GAM783 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM783 target proteins.

[10839] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM783 gene, herein designated GAM GENE, on one or more GAM783 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10840] It is yet further appreciated that specific functions, and accordingly utilities, of GAM783 correlate with, and may be deduced from, the identity of the target genes which GAM783 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10841] Nucleotide sequences of the GAM783 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM783 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM783 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM783 are further described hereinbelow with reference to Table 1.

[10842] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM783 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10843] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 784 (GAM784) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10844] GAM784 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM784 was detected is described hereinabove with reference to Figs. 2-8.

[10845] GAM784 gene, herein designated GAM GENE, and GAM784 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10846] GAM784 gene, herein designated GAM GENE, encodes a GAM784 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM784 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM784 precursor RNA is designated SEQ ID:761, and is provided hereinbelow with reference to the sequence listing part.

[10847] GAM784 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM784 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10848] An enzyme complex designated DICER COMPLEX, dices the GAM784 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM784 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM784 RNA is designated SEQ ID:3362, and is provided hereinbelow with reference to the sequence listing part.

[10849] GAM784 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM784 target RNA, herein designated GAM TARGET RNA. GAM784 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10850] GAM784 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM784

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM784 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM784 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM784 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10851] The complementary binding of GAM784 RNA, herein designated GAM RNA, to target binding sites on GAM784 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM784 target RNA, herein designated GAM TARGET RNA, into GAM784 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10852] It is appreciated that GAM784 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM784 target genes. The mRNA of each one of this plurality of GAM784 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM784 RNA, herein designated GAM RNA, and which when bound by GAM784 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM784 target proteins.

[10853] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM784 gene, herein designated GAM GENE, on one or more GAM784 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10854] It is yet further appreciated that specific functions, and accordingly utilities, of GAM784 correlate with, and may be deduced from, the identity of the target genes which GAM784 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10855] Nucleotide sequences of the GAM784 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM784 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM784 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM784 are further described hereinbelow with

reference to Table 1.

[10856] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM784 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10857] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 785 (GAM785) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10858] GAM785 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM785 was detected is described hereinabove with reference to Figs. 2-8.

[10859] GAM785 gene, herein designated GAM GENE, and GAM785 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10860] GAM785 gene, herein designated GAM GENE, encodes a GAM785 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM785 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM785 precursor RNA is designated SEQ ID:762, and is provided

hereinbelow with reference to the sequence listing part.

[10861] GAM785 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM785 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10862] An enzyme complex designated DICER COMPLEX, dices the GAM785 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM785 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM785 RNA is designated SEQ ID:3364, and is provided hereinbelow with reference to the sequence listing part.

[10863] GAM785 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM785 target RNA, herein designated GAM TARGET RNA. GAM785 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[10864] GAM785 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM785 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM785 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM785 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM785 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10865] The complementary binding of GAM785 RNA, herein designated GAM RNA, to target binding sites on GAM785 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM785 target RNA, herein designated GAM TARGET RNA, into GAM785 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10866] It is appreciated that GAM785 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM785 target genes. The mRNA of each one of this plurality of GAM785 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM785 RNA, herein designated GAM RNA, and which when bound by GAM785 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM785 target proteins.

[10867] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM785 gene, herein designated GAM GENE, on one or more GAM785 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10868] It is yet further appreciated that specific functions, and accordingly utilities, of GAM785 correlate with, and may be deduced from, the identity of the target genes which GAM785 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10869] Nucleotide sequences of the GAM785 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM785 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM785 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM785 are further described hereinbelow with reference to Table 1.

[10870] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM785 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10871] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 786 (GAM786) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10872] GAM786 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM786 was detected is described hereinabove with reference to Figs. 2-8.

[10873] GAM786 gene, herein designated GAM GENE, and GAM786 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10874] GAM786 gene, herein designated GAM GENE, encodes a GAM786 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM786 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM786 precursor RNA is designated SEQ ID:763, and is provided hereinbelow with reference to the sequence listing part.

[10875] GAM786 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM786 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10876] An enzyme complex designated DICER COMPLEX, dices the GAM786 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM786 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM786 RNA is designated SEQ ID:3365, and is provided hereinbelow with reference to the sequence listing part.

[10877] GAM786 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM786 target RNA, herein designated

GAM TARGET RNA. GAM786 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10878] GAM786 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM786 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM786 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM786 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM786 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10879] The complementary binding of GAM786 RNA, herein designated GAM RNA, to target binding sites on GAM786 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM786 target RNA, herein designated GAM

TARGET RNA, into GAM786 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10880] It is appreciated that GAM786 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM786 target genes. The mRNA of each one of this plurality of GAM786 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM786 RNA, herein designated GAM RNA, and which when bound by GAM786 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM786 target proteins.

[10881] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM786 gene, herein designated GAM GENE, on one or more GAM786 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10882] It is yet further appreciated that specific functions, and accordingly utilities, of GAM786 correlate with, and may be deduced from, the identity of the target

genes which GAM786 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10883] Nucleotide sequences of the GAM786 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM786 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM786 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM786 are further described hereinbelow with reference to Table 1.

[10884] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM786 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10885] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 787 (GAM787) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10886] GAM787 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM787 was detected is described hereinabove with reference to Figs. 2-8.

[10887] GAM787 gene, herein designated GAM GENE, and GAM787 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[10888] GAM787 gene, herein designated GAM GENE, encodes a GAM787 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM787 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM787 precursor RNA is designated SEQ ID:764, and is provided hereinbelow with reference to the sequence listing part.

[10889] GAM787 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM787 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10890] An enzyme complex designated DICER COMPLEX, dices the GAM787 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM787 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM787 RNA is designated SEQ ID:3366, and is provided

hereinbelow with reference to the sequence listing part.

[10891] GAM787 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM787 target RNA, herein designated GAM TARGET RNA. GAM787 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10892] GAM787 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM787 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM787 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM787 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM787 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10893] The complementary binding of GAM787 RNA, herein designated GAM RNA, to target binding sites on GAM787 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM787 target RNA, herein designated GAM TARGET RNA, into GAM787 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10894] It is appreciated that GAM787 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM787 target genes. The mRNA of each one of this plurality of GAM787 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM787 RNA, herein designated GAM RNA, and which when bound by GAM787 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM787 target proteins.

[10895] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM787 gene, herein designated GAM GENE, on one or more GAM787 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10896] It is yet further appreciated that specific functions, and accordingly utilities, of GAM787 correlate with, and may be deduced from, the identity of the target genes which GAM787 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10897] Nucleotide sequences of the GAM787 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM787 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM787 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM787 are further described hereinbelow with reference to Table 1.

[10898] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM787 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10899] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 788 (GAM788) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10900] GAM788 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM788 was detected is

described hereinabove with reference to Figs. 2-8.

[10901] GAM788 gene, herein designated GAM GENE, and GAM788 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10902] GAM788 gene, herein designated GAM GENE, encodes a GAM788 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM788 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM788 precursor RNA is designated SEQ ID:765, and is provided hereinbelow with reference to the sequence listing part.

[10903] GAM788 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM788 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10904] An enzyme complex designated DICER COMPLEX, dices the GAM788 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM788 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM788 RNA is designated SEQ ID:3368, and is provided hereinbelow with reference to the sequence listing part.

[10905] GAM788 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM788 target RNA, herein designated GAM TARGET RNA. GAM788 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10906] GAM788 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM788 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM788 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM788 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM788 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10907] The complementary binding of GAM788 RNA, herein designated GAM RNA, to target binding sites on GAM788 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM788 target RNA, herein designated GAM TARGET RNA, into GAM788 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10908] It is appreciated that GAM788 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM788 target genes. The mRNA of each one of this plurality of GAM788 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM788 RNA, herein designated GAM RNA, and which when bound by GAM788 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM788 target proteins.

[10909] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM788 gene, herein designated GAM GENE, on one or more GAM788 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10910] It is yet further appreciated that specific functions, and accordingly utilities, of GAM788 correlate with, and may be deduced from, the identity of the target genes which GAM788 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10911] Nucleotide sequences of the GAM788 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM788 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM788 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM788 are further described hereinbelow with reference to Table 1.

[10912] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM788 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10913] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 789 (GAM789) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10914] GAM789 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM789 was detected is described hereinabove with reference to Figs. 2-8.

[10915] GAM789 gene, herein designated GAM GENE, and GAM789 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10916] GAM789 gene, herein designated GAM GENE, encodes a GAM789 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM789 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM789 precursor RNA is designated SEQ ID:766, and is provided hereinbelow with reference to the sequence listing part.

[10917] GAM789 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM789 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10918] An enzyme complex designated DICER COMPLEX, dices the GAM789 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM789 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM789 RNA is designated SEQ ID:3367, and is provided hereinbelow with reference to the sequence listing part.

[10919] GAM789 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM789 target RNA, herein designated GAM TARGET RNA. GAM789 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10920] GAM789 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM789 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM789 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM789 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM789 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10921] The complementary binding of GAM789 RNA, herein designated GAM RNA, to target binding sites on GAM789 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM789 target RNA, herein designated GAM TARGET RNA, into GAM789 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10922] It is appreciated that GAM789 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM789 target genes. The mRNA of each one of this plurality of GAM789 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM789 RNA, herein designated GAM RNA, and which when bound by GAM789 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM789 target proteins.

[10923] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM789 gene, herein designated GAM GENE, on one or more GAM789 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10924] It is yet further appreciated that specific functions, and accordingly utilities, of GAM789 correlate with, and may be deduced from, the identity of the target genes which GAM789 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10925] Nucleotide sequences of the GAM789 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM789 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM789 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM789 are further described hereinbelow with reference to Table 1.

[10926] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM789 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10927] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 790 (GAM790) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10928] GAM790 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM790 was detected is described hereinabove with reference to Figs. 2-8.

[10929] GAM790 gene, herein designated GAM GENE, and GAM790 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10930] GAM790 gene, herein designated GAM GENE, encodes a GAM790 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM790 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM790 precursor RNA is designated SEQ ID:767, and is provided hereinbelow with reference to the sequence listing part.

[10931] GAM790 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM790 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10932] An enzyme complex designated DICER COMPLEX, dices the GAM790 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM790 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM790 RNA is designated SEQ ID:3369, and is provided hereinbelow with reference to the sequence listing part.

[10933] GAM790 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM790 target RNA, herein designated GAM TARGET RNA. GAM790 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10934] GAM790 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM790 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM790 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM790 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM790 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10935] The complementary binding of GAM790 RNA, herein designated GAM RNA, to target binding sites on GAM790 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM790 target RNA, herein designated GAM TARGET RNA, into GAM790 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10936] It is appreciated that GAM790 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM790 target genes. The mRNA of each one of this plurality of GAM790 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM790 RNA, herein designated GAM RNA, and which when bound by GAM790 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM790 target proteins.

[10937] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM790 gene, herein designated GAM GENE, on one or more

GAM790 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10938] It is yet further appreciated that specific functions, and accordingly utilities, of GAM790 correlate with, and may be deduced from, the identity of the target genes which GAM790 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10939] Nucleotide sequences of the GAM790 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM790 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM790 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM790 are further described hereinbelow with reference to Table 1.

[10940] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM790 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10941] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 791 (GAM791) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10942] GAM791 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM791 was detected is described hereinabove with reference to Figs. 2-8.

[10943] GAM791 gene, herein designated GAM GENE, and GAM791 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10944] GAM791 gene, herein designated GAM GENE, encodes a GAM791 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM791 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM791 precursor RNA is designated SEQ ID:768, and is provided hereinbelow with reference to the sequence listing part.

[10945] GAM791 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM791 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10946] An enzyme complex designated DICER COMPLEX, dices the GAM791 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM791 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM791 RNA is designated SEQ ID:3370, and is provided hereinbelow with reference to the sequence listing part.

[10947] GAM791 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM791 target RNA, herein designated GAM TARGET RNA. GAM791 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10948] GAM791 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM791 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM791 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM791 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM791 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10949] The complementary binding of GAM791 RNA, herein designated GAM RNA, to target binding sites on GAM791 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM791 target RNA, herein designated GAM TARGET RNA, into GAM791 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10950] It is appreciated that GAM791 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM791 target genes. The mRNA of each one of this plurality of GAM791 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM791 RNA, herein designated GAM RNA, and which when bound by GAM791 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM791 target proteins.

[10951] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM791 gene, herein designated GAM GENE, on one or more GAM791 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10952] It is yet further appreciated that specific functions, and accordingly utilities, of GAM791 correlate with, and may be deduced from, the identity of the target genes which GAM791 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10953] Nucleotide sequences of the GAM791 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM791 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM791 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM791 are further described hereinbelow with reference to Table 1.

[10954] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM791 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10955] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 792 (GAM792) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10956] GAM792 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM792 was detected is described hereinabove with reference to Figs. 2-8.

[10957] GAM792 gene, herein designated GAM GENE, and GAM792 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10958] GAM792 gene, herein designated GAM GENE, encodes a GAM792 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM792 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM792 precursor RNA is designated SEQ ID:769, and is provided hereinbelow with reference to the sequence listing part.

[10959] GAM792 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM792 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10960] An enzyme complex designated DICER COMPLEX, dices the GAM792 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM792 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM792 RNA is designated SEQ ID:3371, and is provided hereinbelow with reference to the sequence listing part.

[10961] GAM792 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM792 target RNA, herein designated GAM TARGET RNA. GAM792 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10962] GAM792 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM792

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM792 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM792 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM792 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10963] The complementary binding of GAM792 RNA, herein designated GAM RNA, to target binding sites on GAM792 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM792 target RNA, herein designated GAM TARGET RNA, into GAM792 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10964] It is appreciated that GAM792 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM792 target genes. The mRNA of each one of this plurality of GAM792 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM792 RNA, herein designated GAM RNA, and which when bound by GAM792 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM792 target proteins.

[10965] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM792 gene, herein designated GAM GENE, on one or more GAM792 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10966] It is yet further appreciated that specific functions, and accordingly utilities, of GAM792 correlate with, and may be deduced from, the identity of the target genes which GAM792 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10967] Nucleotide sequences of the GAM792 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM792 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM792 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM792 are further described hereinbelow with

reference to Table 1.

[10968] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM792 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10969] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 793 (GAM793) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10970] GAM793 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM793 was detected is described hereinabove with reference to Figs. 2-8.

[10971] GAM793 gene, herein designated GAM GENE, and GAM793 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10972] GAM793 gene, herein designated GAM GENE, encodes a GAM793 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM793 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM793 precursor RNA is designated SEQ ID:770, and is provided

hereinbelow with reference to the sequence listing part.

[10973] GAM793 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM793 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10974] An enzyme complex designated DICER COMPLEX, dices the GAM793 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM793 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM793 RNA is designated SEQ ID:3372, and is provided hereinbelow with reference to the sequence listing part.

[10975] GAM793 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM793 target RNA, herein designated GAM TARGET RNA. GAM793 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[10976] GAM793 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM793 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM793 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM793 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM793 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10977] The complementary binding of GAM793 RNA, herein designated GAM RNA, to target binding sites on GAM793 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM793 target RNA, herein designated GAM TARGET RNA, into GAM793 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10978] It is appreciated that GAM793 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM793 target genes. The mRNA of each one of this plurality of GAM793 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM793 RNA, herein designated GAM RNA, and which when bound by GAM793 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM793 target proteins.

[10979] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM793 gene, herein designated GAM GENE, on one or more GAM793 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10980] It is yet further appreciated that specific functions, and accordingly utilities, of GAM793 correlate with, and may be deduced from, the identity of the target genes which GAM793 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10981] Nucleotide sequences of the GAM793 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM793 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM793 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM793 are further described hereinbelow with reference to Table 1.

[10982] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM793 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10983] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 794 (GAM794) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10984] GAM794 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM794 was detected is described hereinabove with reference to Figs. 2-8.

[10985] GAM794 gene, herein designated GAM GENE, and GAM794 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[10986] GAM794 gene, herein designated GAM GENE, encodes a GAM794 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM794 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM794 precursor RNA is designated SEQ ID:771, and is provided hereinbelow with reference to the sequence listing part.

[10987] GAM794 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM794 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10988] An enzyme complex designated DICER COMPLEX, dices the GAM794 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM794 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM794 RNA is designated SEQ ID:3373, and is provided hereinbelow with reference to the sequence listing part.

[10989] GAM794 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM794 target RNA, herein designated

GAM TARGET RNA. GAM794 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10990] GAM794 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM794 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM794 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM794 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM794 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10991] The complementary binding of GAM794 RNA, herein designated GAM RNA, to target binding sites on GAM794 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM794 target RNA, herein designated GAM

TARGET RNA, into GAM794 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[10992] It is appreciated that GAM794 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM794 target genes. The mRNA of each one of this plurality of GAM794 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM794 RNA, herein designated GAM RNA, and which when bound by GAM794 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM794 target proteins.

[10993] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM794 gene, herein designated GAM GENE, on one or more GAM794 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10994] It is yet further appreciated that specific functions, and accordingly utilities, of GAM794 correlate with, and may be deduced from, the identity of the target

genes which GAM794 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10995] Nucleotide sequences of the GAM794 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM794 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM794 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM794 are further described hereinbelow with reference to Table 1.

[10996] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM794 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[10997] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 795 (GAM795) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[10998] GAM795 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM795 was detected is described hereinabove with reference to Figs. 2-8.

[10999] GAM795 gene, herein designated GAM GENE, and GAM795 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[11000] GAM795 gene, herein designated GAM GENE, encodes a GAM795 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM795 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM795 precursor RNA is designated SEQ ID:772, and is provided hereinbelow with reference to the sequence listing part.

[11001] GAM795 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM795 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11002] An enzyme complex designated DICER COMPLEX, dices the GAM795 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM795 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM795 RNA is designated SEQ ID:3374, and is provided

hereinbelow with reference to the sequence listing part.

[11003] GAM795 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM795 target RNA, herein designated GAM TARGET RNA. GAM795 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11004] GAM795 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM795 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM795 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM795 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM795 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11005] The complementary binding of GAM795 RNA, herein designated GAM RNA, to target binding sites on GAM795 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM795 target RNA, herein designated GAM TARGET RNA, into GAM795 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11006] It is appreciated that GAM795 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM795 target genes. The mRNA of each one of this plurality of GAM795 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM795 RNA, herein designated GAM RNA, and which when bound by GAM795 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM795 target proteins.

[11007] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM795 gene, herein designated GAM GENE, on one or more GAM795 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11008] It is yet further appreciated that specific functions, and accordingly utilities, of GAM795 correlate with, and may be deduced from, the identity of the target genes which GAM795 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11009] Nucleotide sequences of the GAM795 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM795 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM795 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM795 are further described hereinbelow with reference to Table 1.

[11010] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM795 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11011] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 796 (GAM796) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11012] GAM796 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM796 was detected is

described hereinabove with reference to Figs. 2-8.

[11013] GAM796 gene, herein designated GAM GENE, and GAM796 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11014] GAM796 gene, herein designated GAM GENE, encodes a GAM796 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM796 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM796 precursor RNA is designated SEQ ID:773, and is provided hereinbelow with reference to the sequence listing part.

[11015] GAM796 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM796 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11016] An enzyme complex designated DICER COMPLEX, dices the GAM796 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM796 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM796 RNA is designated SEQ ID:3375, and is provided hereinbelow with reference to the sequence listing part.

[11017] GAM796 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM796 target RNA, herein designated GAM TARGET RNA. GAM796 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11018] GAM796 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM796 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM796 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM796 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM796 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11019] The complementary binding of GAM796 RNA, herein designated GAM RNA, to target binding sites on GAM796 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM796 target RNA, herein designated GAM TARGET RNA, into GAM796 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11020] It is appreciated that GAM796 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM796 target genes. The mRNA of each one of this plurality of GAM796 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM796 RNA, herein designated GAM RNA, and which when bound by GAM796 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM796 target proteins.

[11021] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM796 gene, herein designated GAM GENE, on one or more GAM796 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11022] It is yet further appreciated that specific functions, and accordingly utilities, of GAM796 correlate with, and may be deduced from, the identity of the target genes which GAM796 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11023] Nucleotide sequences of the GAM796 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM796 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM796 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM796 are further described hereinbelow with reference to Table 1.

[11024] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM796 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11025] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 797 (GAM797) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11026] GAM797 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM797 was detected is described hereinabove with reference to Figs. 2-8.

[11027] GAM797 gene, herein designated GAM GENE, and GAM797 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11028] GAM797 gene, herein designated GAM GENE, encodes a GAM797 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM797 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM797 precursor RNA is designated SEQ ID:774, and is provided hereinbelow with reference to the sequence listing part.

[11029] GAM797 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM797 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11030] An enzyme complex designated DICER COMPLEX, dices the GAM797 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM797 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM797 RNA is designated SEQ ID:3376, and is provided hereinbelow with reference to the sequence listing part.

[11031] GAM797 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM797 target RNA, herein designated GAM TARGET RNA. GAM797 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11032] GAM797 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM797 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM797 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM797 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM797 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11033] The complementary binding of GAM797 RNA, herein designated GAM RNA, to target binding sites on GAM797 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM797 target RNA, herein designated GAM TARGET RNA, into GAM797 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11034] It is appreciated that GAM797 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM797 target genes. The mRNA of each one of this plurality of GAM797 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM797 RNA, herein designated GAM RNA, and which when bound by GAM797 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM797 target proteins.

[11035] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM797 gene, herein designated GAM GENE, on one or more GAM797 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11036] It is yet further appreciated that specific functions, and accordingly utilities, of GAM797 correlate with, and may be deduced from, the identity of the target genes which GAM797 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11037] Nucleotide sequences of the GAM797 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM797 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM797 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM797 are further described hereinbelow with reference to Table 1.

[11038] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM797 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11039] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 798 (GAM798) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11040] GAM798 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM798 was detected is described hereinabove with reference to Figs. 2-8.

[11041] GAM798 gene, herein designated GAM GENE, and GAM798 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11042] GAM798 gene, herein designated GAM GENE, encodes a GAM798 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM798 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM798 precursor RNA is designated SEQ ID:775, and is provided hereinbelow with reference to the sequence listing part.

[11043] GAM798 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM798 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11044] An enzyme complex designated DICER COMPLEX, dices the GAM798 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM798 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM798 RNA is designated SEQ ID:3378, and is provided hereinbelow with reference to the sequence listing part.

[11045] GAM798 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM798 target RNA, herein designated GAM TARGET RNA. GAM798 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11046] GAM798 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM798 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM798 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM798 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM798 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11047] The complementary binding of GAM798 RNA, herein designated GAM RNA, to target binding sites on GAM798 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM798 target RNA, herein designated GAM TARGET RNA, into GAM798 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11048] It is appreciated that GAM798 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM798 target genes. The mRNA of each one of this plurality of GAM798 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM798 RNA, herein designated GAM RNA, and which when bound by GAM798 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM798 target proteins.

[11049] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM798 gene, herein designated GAM GENE, on one or more

GAM798 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11050] It is yet further appreciated that specific functions, and accordingly utilities, of GAM798 correlate with, and may be deduced from, the identity of the target genes which GAM798 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11051] Nucleotide sequences of the GAM798 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM798 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM798 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM798 are further described hereinbelow with reference to Table 1.

[11052] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM798 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11053] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 799 (GAM799) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11054] GAM799 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM799 was detected is described hereinabove with reference to Figs. 2-8.

[11055] GAM799 gene, herein designated GAM GENE, and GAM799 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11056] GAM799 gene, herein designated GAM GENE, encodes a GAM799 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM799 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM799 precursor RNA is designated SEQ ID:776, and is provided hereinbelow with reference to the sequence listing part.

[11057] GAM799 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11058] An enzyme complex designated DICER COMPLEX, dices the GAM799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM799 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM799 RNA is designated SEQ ID:3377, and is provided hereinbelow with reference to the sequence listing part.

[11059] GAM799 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM799 target RNA, herein designated GAM TARGET RNA. GAM799 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11060] GAM799 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM799 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM799 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM799 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM799 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11061] The complementary binding of GAM799 RNA, herein designated GAM RNA, to target binding sites on GAM799 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM799 target RNA, herein designated GAM TARGET RNA, into GAM799 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11062] It is appreciated that GAM799 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM799 target genes. The mRNA of each one of this plurality of GAM799 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM799 RNA, herein designated GAM RNA, and which when bound by GAM799 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM799 target proteins.

[11063] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM799 gene, herein designated GAM GENE, on one or more GAM799 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11064] It is yet further appreciated that specific functions, and accordingly utilities, of GAM799 correlate with, and may be deduced from, the identity of the target genes which GAM799 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11065] Nucleotide sequences of the GAM799 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM799 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM799 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM799 are further described hereinbelow with reference to Table 1.

[11066] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM799 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11067] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 800 (GAM800) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11068] GAM800 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM800 was detected is described hereinabove with reference to Figs. 2-8.

[11069] GAM800 gene, herein designated GAM GENE, and GAM800 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11070] GAM800 gene, herein designated GAM GENE, encodes a GAM800 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM800 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM800 precursor RNA is designated SEQ ID:777, and is provided hereinbelow with reference to the sequence listing part.

[11071] GAM800 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM800 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11072] An enzyme complex designated DICER COMPLEX, dices the GAM800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM800 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM800 RNA is designated SEQ ID:3379, and is provided hereinbelow with reference to the sequence listing part.

[11073] GAM800 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM800 target RNA, herein designated GAM TARGET RNA. GAM800 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11074] GAM800 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM800

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM800 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM800 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM800 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11075] The complementary binding of GAM800 RNA, herein designated GAM RNA, to target binding sites on GAM800 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM800 target RNA, herein designated GAM TARGET RNA, into GAM800 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11076] It is appreciated that GAM800 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM800 target genes. The mRNA of each one of this plurality of GAM800 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM800 RNA, herein designated GAM RNA, and which when bound by GAM800 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM800 target proteins.

[11077] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM800 gene, herein designated GAM GENE, on one or more GAM800 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11078] It is yet further appreciated that specific functions, and accordingly utilities, of GAM800 correlate with, and may be deduced from, the identity of the target genes which GAM800 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11079] Nucleotide sequences of the GAM800 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM800 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM800 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM800 are further described hereinbelow with

reference to Table 1.

[11080] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM800 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11081] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 801 (GAM801) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11082] GAM801 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM801 was detected is described hereinabove with reference to Figs. 2-8.

[11083] GAM801 gene, herein designated GAM GENE, and GAM801 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11084] GAM801 gene, herein designated GAM GENE, encodes a GAM801 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM801 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM801 precursor RNA is designated SEQ ID:778, and is provided

hereinbelow with reference to the sequence listing part.

[11085] GAM801 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM801 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11086] An enzyme complex designated DICER COMPLEX, dices the GAM801 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM801 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM801 RNA is designated SEQ ID:3380, and is provided hereinbelow with reference to the sequence listing part.

[11087] GAM801 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM801 target RNA, herein designated GAM TARGET RNA. GAM801 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[11088] GAM801 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM801 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM801 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM801 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM801 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11089] The complementary binding of GAM801 RNA, herein designated GAM RNA, to target binding sites on GAM801 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM801 target RNA, herein designated GAM TARGET RNA, into GAM801 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11090] It is appreciated that GAM801 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM801 target genes. The mRNA of each one of this plurality of GAM801 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM801 RNA, herein designated GAM RNA, and which when bound by GAM801 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM801 target proteins.

[11091] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM801 gene, herein designated GAM GENE, on one or more GAM801 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11092] It is yet further appreciated that specific functions, and accordingly utilities, of GAM801 correlate with, and may be deduced from, the identity of the target genes which GAM801 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11093] Nucleotide sequences of the GAM801 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM801 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM801 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM801 are further described hereinbelow with reference to Table 1.

[11094] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM801 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11095] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 802 (GAM802) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11096] GAM802 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM802 was detected is described hereinabove with reference to Figs. 2-8.

[11097] GAM802 gene, herein designated GAM GENE, and GAM802 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11098] GAM802 gene, herein designated GAM GENE, encodes a GAM802 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM802 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM802 precursor RNA is designated SEQ ID:779, and is provided hereinbelow with reference to the sequence listing part.

[11099] GAM802 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM802 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11100] An enzyme complex designated DICER COMPLEX, dices the GAM802 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM802 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM802 RNA is designated SEQ ID:3381, and is provided hereinbelow with reference to the sequence listing part.

[11101] GAM802 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM802 target RNA, herein designated

GAM TARGET RNA. GAM802 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11102] GAM802 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM802 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM802 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM802 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM802 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11103] The complementary binding of GAM802 RNA, herein designated GAM RNA, to target binding sites on GAM802 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM802 target RNA, herein designated GAM

TARGET RNA, into GAM802 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11104] It is appreciated that GAM802 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM802 target genes. The mRNA of each one of this plurality of GAM802 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM802 RNA, herein designated GAM RNA, and which when bound by GAM802 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM802 target proteins.

[11105] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM802 gene, herein designated GAM GENE, on one or more GAM802 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11106] It is yet further appreciated that specific functions, and accordingly utilities, of GAM802 correlate with, and may be deduced from, the identity of the target

genes which GAM802 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11107] Nucleotide sequences of the GAM802 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM802 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM802 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM802 are further described hereinbelow with reference to Table 1.

[11108] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM802 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11109] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 803 (GAM803) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11110] GAM803 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM803 was detected is described hereinabove with reference to Figs. 2-8.

[11111] GAM803 gene, herein designated GAM GENE, and GAM803 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[11112] GAM803 gene, herein designated GAM GENE, encodes a GAM803 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM803 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM803 precursor RNA is designated SEQ ID:780, and is provided hereinbelow with reference to the sequence listing part.

[11113] GAM803 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM803 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11114] An enzyme complex designated DICER COMPLEX, dices the GAM803 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM803 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM803 RNA is designated SEQ ID:3382, and is provided

hereinbelow with reference to the sequence listing part.

[11115] GAM803 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM803 target RNA, herein designated GAM TARGET RNA. GAM803 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11116] GAM803 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM803 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM803 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM803 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM803 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11117] The complementary binding of GAM803 RNA, herein designated GAM RNA, to target binding sites on GAM803 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM803 target RNA, herein designated GAM TARGET RNA, into GAM803 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11118] It is appreciated that GAM803 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM803 target genes. The mRNA of each one of this plurality of GAM803 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM803 RNA, herein designated GAM RNA, and which when bound by GAM803 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM803 target proteins.

[11119] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM803 gene, herein designated GAM GENE, on one or more GAM803 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11120] It is yet further appreciated that specific functions, and accordingly utilities, of GAM803 correlate with, and may be deduced from, the identity of the target genes which GAM803 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11121] Nucleotide sequences of the GAM803 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM803 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM803 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM803 are further described hereinbelow with reference to Table 1.

[11122] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM803 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11123] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 804 (GAM804) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11124] GAM804 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM804 was detected is

described hereinabove with reference to Figs. 2-8.

[11125] GAM804 gene, herein designated GAM GENE, and GAM804 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11126] GAM804 gene, herein designated GAM GENE, encodes a GAM804 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM804 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM804 precursor RNA is designated SEQ ID:781, and is provided hereinbelow with reference to the sequence listing part.

[11127] GAM804 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM804 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11128] An enzyme complex designated DICER COMPLEX, dices the GAM804 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM804 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM804 RNA is designated SEQ ID:3383, and is provided hereinbelow with reference to the sequence listing part.

[11129] GAM804 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM804 target RNA, herein designated GAM TARGET RNA. GAM804 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11130] GAM804 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM804 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM804 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM804 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM804 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11131] The complementary binding of GAM804 RNA, herein designated GAM RNA, to target binding sites on GAM804 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM804 target RNA, herein designated GAM TARGET RNA, into GAM804 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11132] It is appreciated that GAM804 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM804 target genes. The mRNA of each one of this plurality of GAM804 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM804 RNA, herein designated GAM RNA, and which when bound by GAM804 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM804 target proteins.

[11133] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM804 gene, herein designated GAM GENE, on one or more GAM804 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11134] It is yet further appreciated that specific functions, and accordingly utilities, of GAM804 correlate with, and may be deduced from, the identity of the target genes which GAM804 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11135] Nucleotide sequences of the GAM804 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM804 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM804 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM804 are further described hereinbelow with reference to Table 1.

[11136] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM804 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11137] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 805 (GAM805) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11138] GAM805 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM805 was detected is described hereinabove with reference to Figs. 2-8.

[11139] GAM805 gene, herein designated GAM GENE, and GAM805 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11140] GAM805 gene, herein designated GAM GENE, encodes a GAM805 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM805 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM805 precursor RNA is designated SEQ ID:782, and is provided hereinbelow with reference to the sequence listing part.

[11141] GAM805 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM805 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11142] An enzyme complex designated DICER COMPLEX, dices the GAM805 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM805 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM805 RNA is designated SEQ ID:3384, and is provided hereinbelow with reference to the sequence listing part.

[11143] GAM805 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM805 target RNA, herein designated GAM TARGET RNA. GAM805 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11144] GAM805 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM805 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM805 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM805 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM805 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11145] The complementary binding of GAM805 RNA, herein designated GAM RNA, to target binding sites on GAM805 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM805 target RNA, herein designated GAM TARGET RNA, into GAM805 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11146] It is appreciated that GAM805 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM805 target genes. The mRNA of each one of this plurality of GAM805 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM805 RNA, herein designated GAM RNA, and which when bound by GAM805 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM805 target proteins.

[11147] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM805 gene, herein designated GAM GENE, on one or more GAM805 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11148] It is yet further appreciated that specific functions, and accordingly utilities, of GAM805 correlate with, and may be deduced from, the identity of the target genes which GAM805 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11149] Nucleotide sequences of the GAM805 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM805 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM805 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM805 are further described hereinbelow with reference to Table 1.

[11150] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM805 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11151] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 806 (GAM806) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11152] GAM806 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM806 was detected is described hereinabove with reference to Figs. 2-8.

[11153] GAM806 gene, herein designated GAM GENE, and GAM806 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11154] GAM806 gene, herein designated GAM GENE, encodes a GAM806 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM806 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM806 precursor RNA is designated SEQ ID:783, and is provided hereinbelow with reference to the sequence listing part.

[11155] GAM806 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM806 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11156] An enzyme complex designated DICER COMPLEX, dices the GAM806 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM806 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM806 RNA is designated SEQ ID:3385, and is provided hereinbelow with reference to the sequence listing part.

[11157] GAM806 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM806 target RNA, herein designated GAM TARGET RNA. GAM806 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11158] GAM806 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM806 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM806 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM806 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM806 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11159] The complementary binding of GAM806 RNA, herein designated GAM RNA, to target binding sites on GAM806 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM806 target RNA, herein designated GAM TARGET RNA, into GAM806 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11160] It is appreciated that GAM806 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM806 target genes. The mRNA of each one of this plurality of GAM806 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM806 RNA, herein designated GAM RNA, and which when bound by GAM806 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM806 target proteins.

[11161] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM806 gene, herein designated GAM GENE, on one or more

GAM806 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11162] It is yet further appreciated that specific functions, and accordingly utilities, of GAM806 correlate with, and may be deduced from, the identity of the target genes which GAM806 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11163] Nucleotide sequences of the GAM806 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM806 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM806 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM806 are further described hereinbelow with reference to Table 1.

[11164] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM806 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11165] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 807 (GAM807) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11166] GAM807 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM807 was detected is described hereinabove with reference to Figs. 2-8.

[11167] GAM807 gene, herein designated GAM GENE, and GAM807 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11168] GAM807 gene, herein designated GAM GENE, encodes a GAM807 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM807 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM807 precursor RNA is designated SEQ ID:784, and is provided hereinbelow with reference to the sequence listing part.

[11169] GAM807 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11170] An enzyme complex designated DICER COMPLEX, dices the GAM807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM807 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM807 RNA is designated SEQ ID:3386, and is provided hereinbelow with reference to the sequence listing part.

[11171] GAM807 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM807 target RNA, herein designated GAM TARGET RNA. GAM807 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11172] GAM807 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM807 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM807 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM807 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM807 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11173] The complementary binding of GAM807 RNA, herein designated GAM RNA, to target binding sites on GAM807 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM807 target RNA, herein designated GAM TARGET RNA, into GAM807 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11174] It is appreciated that GAM807 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM807 target genes. The mRNA of each one of this plurality of GAM807 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM807 RNA, herein designated GAM RNA, and which when bound by GAM807 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM807 target proteins.

[11175] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM807 gene, herein designated GAM GENE, on one or more GAM807 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11176] It is yet further appreciated that specific functions, and accordingly utilities, of GAM807 correlate with, and may be deduced from, the identity of the target genes which GAM807 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11177] Nucleotide sequences of the GAM807 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM807 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM807 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM807 are further described hereinbelow with reference to Table 1.

[11178] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM807 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11179] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 808 (GAM808) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11180] GAM808 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM808 was detected is described hereinabove with reference to Figs. 2-8.

[11181] GAM808 gene, herein designated GAM GENE, and GAM808 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11182] GAM808 gene, herein designated GAM GENE, encodes a GAM808 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM808 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM808 precursor RNA is designated SEQ ID:785, and is provided hereinbelow with reference to the sequence listing part.

[11183] GAM808 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM808 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11184] An enzyme complex designated DICER COMPLEX, dices the GAM808 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM808 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM808 RNA is designated SEQ ID:3387, and is provided hereinbelow with reference to the sequence listing part.

[11185] GAM808 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM808 target RNA, herein designated GAM TARGET RNA. GAM808 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11186] GAM808 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM808

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM808 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM808 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM808 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11187] The complementary binding of GAM808 RNA, herein designated GAM RNA, to target binding sites on GAM808 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM808 target RNA, herein designated GAM TARGET RNA, into GAM808 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11188] It is appreciated that GAM808 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM808 target genes. The mRNA of each one of this plurality of GAM808 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM808 RNA, herein designated GAM RNA, and which when bound by GAM808 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM808 target proteins.

[11189] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM808 gene, herein designated GAM GENE, on one or more GAM808 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11190] It is yet further appreciated that specific functions, and accordingly utilities, of GAM808 correlate with, and may be deduced from, the identity of the target genes which GAM808 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11191] Nucleotide sequences of the GAM808 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM808 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM808 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM808 are further described hereinbelow with

reference to Table 1.

[11192] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM808 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11193] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 809 (GAM809) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11194] GAM809 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM809 was detected is described hereinabove with reference to Figs. 2-8.

[11195] GAM809 gene, herein designated GAM GENE, and GAM809 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11196] GAM809 gene, herein designated GAM GENE, encodes a GAM809 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM809 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM809 precursor RNA is designated SEQ ID:786, and is provided

hereinbelow with reference to the sequence listing part.

[11197] GAM809 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11198] An enzyme complex designated DICER COMPLEX, dices the GAM809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM809 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM809 RNA is designated SEQ ID:3388, and is provided hereinbelow with reference to the sequence listing part.

[11199] GAM809 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM809 target RNA, herein designated GAM TARGET RNA. GAM809 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[11200] GAM809 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM809 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM809 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM809 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM809 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11201] The complementary binding of GAM809 RNA, herein designated GAM RNA, to target binding sites on GAM809 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM809 target RNA, herein designated GAM TARGET RNA, into GAM809 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11202] It is appreciated that GAM809 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM809 target genes. The mRNA of each one of this plurality of GAM809 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM809 RNA, herein designated GAM RNA, and which when bound by GAM809 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM809 target proteins.

[11203] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM809 gene, herein designated GAM GENE, on one or more GAM809 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11204] It is yet further appreciated that specific functions, and accordingly utilities, of GAM809 correlate with, and may be deduced from, the identity of the target genes which GAM809 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11205] Nucleotide sequences of the GAM809 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM809 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM809 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM809 are further described hereinbelow with reference to Table 1.

[11206] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM809 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11207] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 810 (GAM810) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11208] GAM810 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM810 was detected is described hereinabove with reference to Figs. 2-8.

[11209] GAM810 gene, herein designated GAM GENE, and GAM810 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11210] GAM810 gene, herein designated GAM GENE, encodes a GAM810 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM810 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM810 precursor RNA is designated SEQ ID:787, and is provided hereinbelow with reference to the sequence listing part.

[11211] GAM810 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM810 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11212] An enzyme complex designated DICER COMPLEX, dices the GAM810 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM810 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM810 RNA is designated SEQ ID:3389, and is provided hereinbelow with reference to the sequence listing part.

[11213] GAM810 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM810 target RNA, herein designated

GAM TARGET RNA. GAM810 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11214] GAM810 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM810 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM810 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM810 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM810 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11215] The complementary binding of GAM810 RNA, herein designated GAM RNA, to target binding sites on GAM810 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM810 target RNA, herein designated GAM

TARGET RNA, into GAM810 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11216] It is appreciated that GAM810 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM810 target genes. The mRNA of each one of this plurality of GAM810 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM810 RNA, herein designated GAM RNA, and which when bound by GAM810 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM810 target proteins.

[11217] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM810 gene, herein designated GAM GENE, on one or more GAM810 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11218] It is yet further appreciated that specific functions, and accordingly utilities, of GAM810 correlate with, and may be deduced from, the identity of the target

genes which GAM810 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11219] Nucleotide sequences of the GAM810 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM810 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM810 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM810 are further described hereinbelow with reference to Table 1.

[11220] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM810 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11221] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 811 (GAM811) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11222] GAM811 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM811 was detected is described hereinabove with reference to Figs. 2-8.

[11223] GAM811 gene, herein designated GAM GENE, and GAM811 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[11224] GAM811 gene, herein designated GAM GENE, encodes a GAM811 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM811 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM811 precursor RNA is designated SEQ ID:788, and is provided hereinbelow with reference to the sequence listing part.

[11225] GAM811 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM811 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11226] An enzyme complex designated DICER COMPLEX, dices the GAM811 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM811 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM811 RNA is designated SEQ ID:3390, and is provided

hereinbelow with reference to the sequence listing part.

[11227] GAM811 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM811 target RNA, herein designated GAM TARGET RNA. GAM811 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11228] GAM811 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM811 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM811 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM811 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM811 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11229] The complementary binding of GAM811 RNA, herein designated GAM RNA, to target binding sites on GAM811 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM811 target RNA, herein designated GAM TARGET RNA, into GAM811 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11230] It is appreciated that GAM811 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM811 target genes. The mRNA of each one of this plurality of GAM811 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM811 RNA, herein designated GAM RNA, and which when bound by GAM811 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM811 target proteins.

[11231] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM811 gene, herein designated GAM GENE, on one or more GAM811 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11232] It is yet further appreciated that specific functions, and accordingly utilities, of GAM811 correlate with, and may be deduced from, the identity of the target genes which GAM811 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11233] Nucleotide sequences of the GAM811 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM811 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM811 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM811 are further described hereinbelow with reference to Table 1.

[11234] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM811 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11235] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 812 (GAM812) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11236] GAM812 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM812 was detected is described hereinabove with reference to Figs. 2-8.

[11237] GAM812 gene, herein designated GAM GENE, and GAM812 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11238] GAM812 gene, herein designated GAM GENE, encodes a GAM812 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM812 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM812 precursor RNA is designated SEQ ID:789, and is provided hereinbelow with reference to the sequence listing part.

[11239] GAM812 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM812 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11240] An enzyme complex designated DICER COMPLEX, dices the GAM812 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM812 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of GAM812 RNA is designated SEQ ID:3391, and is provided hereinbelow with reference to the sequence listing part.

[11241] GAM812 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM812 target RNA, herein designated GAM TARGET RNA. GAM812 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11242] GAM812 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM812 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM812 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM812 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM812 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11243] The complementary binding of GAM812 RNA, herein designated GAM RNA, to target binding sites on GAM812 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM812 target RNA, herein designated GAM TARGET RNA, into GAM812 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11244] It is appreciated that GAM812 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM812 target genes. The mRNA of each one of this plurality of GAM812 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM812 RNA, herein designated GAM RNA, and which when bound by GAM812 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM812 target proteins.

[11245] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM812 gene, herein designated GAM GENE, on one or more GAM812 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11246] It is yet further appreciated that specific functions, and accordingly utilities, of GAM812 correlate with, and may be deduced from, the identity of the target genes which GAM812 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11247] Nucleotide sequences of the GAM812 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM812 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM812 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM812 are further described hereinbelow with reference to Table 1.

[11248] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM812 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11249] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 813 (GAM813) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11250] GAM813 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM813 was detected is described hereinabove with reference to Figs. 2-8.

[11251] GAM813 gene, herein designated GAM GENE, and GAM813 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11252] GAM813 gene, herein designated GAM GENE, encodes a GAM813 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM813 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM813 precursor RNA is designated SEQ ID:790, and is provided hereinbelow with reference to the sequence listing part.

[11253] GAM813 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM813 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11254] An enzyme complex designated DICER COMPLEX, dices the GAM813 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM813 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM813 RNA is designated SEQ ID:3392, and is provided hereinbelow with reference to the sequence listing part.

[11255] GAM813 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM813 target RNA, herein designated GAM TARGET RNA. GAM813 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11256] GAM813 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM813

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM813 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM813 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM813 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11257] The complementary binding of GAM813 RNA, herein designated GAM RNA, to target binding sites on GAM813 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM813 target RNA, herein designated GAM TARGET RNA, into GAM813 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11258] It is appreciated that GAM813 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM813 target genes. The mRNA of each one of this plurality of GAM813 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM813 RNA, herein designated GAM RNA, and which when bound by GAM813 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM813 target proteins.

[11259] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM813 gene, herein designated GAM GENE, on one or more GAM813 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11260] It is yet further appreciated that specific functions, and accordingly utilities, of GAM813 correlate with, and may be deduced from, the identity of the target genes which GAM813 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11261] Nucleotide sequences of the GAM813 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM813 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM813 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM813 are further described hereinbelow with

reference to Table 1.

[11262] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM813 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11263] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 814 (GAM814) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11264] GAM814 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM814 was detected is described hereinabove with reference to Figs. 2-8.

[11265] GAM814 gene, herein designated GAM GENE, and GAM814 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11266] GAM814 gene, herein designated GAM GENE, encodes a GAM814 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM814 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM814 precursor RNA is designated SEQ ID:791, and is provided

hereinbelow with reference to the sequence listing part.

[11267] GAM814 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11268] An enzyme complex designated DICER COMPLEX, dices the GAM814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM814 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM814 RNA is designated SEQ ID:3393, and is provided hereinbelow with reference to the sequence listing part.

[11269] GAM814 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM814 target RNA, herein designated GAM TARGET RNA. GAM814 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[11270] GAM814 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM814 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM814 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM814 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM814 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11271] The complementary binding of GAM814 RNA, herein designated GAM RNA, to target binding sites on GAM814 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM814 target RNA, herein designated GAM TARGET RNA, into GAM814 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11272] It is appreciated that GAM814 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM814 target genes. The mRNA of each one of this plurality of GAM814 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM814 RNA, herein designated GAM RNA, and which when bound by GAM814 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM814 target proteins.

[11273] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM814 gene, herein designated GAM GENE, on one or more GAM814 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11274] It is yet further appreciated that specific functions, and accordingly utilities, of GAM814 correlate with, and may be deduced from, the identity of the target genes which GAM814 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11275] Nucleotide sequences of the GAM814 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM814 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM814 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM814 are further described hereinbelow with reference to Table 1.

[11276] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM814 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11277] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 815 (GAM815) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11278] GAM815 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM815 was detected is described hereinabove with reference to Figs. 2-8.

[11279] GAM815 gene, herein designated GAM GENE, and GAM815 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11280] GAM815 gene, herein designated GAM GENE, encodes a GAM815 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM815 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM815 precursor RNA is designated SEQ ID:792, and is provided hereinbelow with reference to the sequence listing part.

[11281] GAM815 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM815 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11282] An enzyme complex designated DICER COMPLEX, dices the GAM815 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM815 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM815 RNA is designated SEQ ID:3394, and is provided hereinbelow with reference to the sequence listing part.

[11283] GAM815 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM815 target RNA, herein designated

GAM TARGET RNA. GAM815 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11284] GAM815 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM815 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM815 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM815 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM815 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11285] The complementary binding of GAM815 RNA, herein designated GAM RNA, to target binding sites on GAM815 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM815 target RNA, herein designated GAM

TARGET RNA, into GAM815 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11286] It is appreciated that GAM815 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM815 target genes. The mRNA of each one of this plurality of GAM815 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM815 RNA, herein designated GAM RNA, and which when bound by GAM815 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM815 target proteins.

[11287] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM815 gene, herein designated GAM GENE, on one or more GAM815 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11288] It is yet further appreciated that specific functions, and accordingly utilities, of GAM815 correlate with, and may be deduced from, the identity of the target

genes which GAM815 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11289] Nucleotide sequences of the GAM815 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM815 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM815 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM815 are further described hereinbelow with reference to Table 1.

[11290] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM815 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11291] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 816 (GAM816) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11292] GAM816 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM816 was detected is described hereinabove with reference to Figs. 2-8.

[11293] GAM816 gene, herein designated GAM GENE, and GAM816 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[11294] GAM816 gene, herein designated GAM GENE, encodes a GAM816 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM816 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM816 precursor RNA is designated SEQ ID:793, and is provided hereinbelow with reference to the sequence listing part.

[11295] GAM816 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM816 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11296] An enzyme complex designated DICER COMPLEX, dices the GAM816 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM816 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM816 RNA is designated SEQ ID:3397, and is provided

hereinbelow with reference to the sequence listing part.

[11297] GAM816 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM816 target RNA, herein designated GAM TARGET RNA. GAM816 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11298] GAM816 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM816 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM816 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM816 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM816 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11299] The complementary binding of GAM816 RNA, herein designated GAM RNA, to target binding sites on GAM816 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM816 target RNA, herein designated GAM TARGET RNA, into GAM816 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11300] It is appreciated that GAM816 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM816 target genes. The mRNA of each one of this plurality of GAM816 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM816 RNA, herein designated GAM RNA, and which when bound by GAM816 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM816 target proteins.

[11301] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM816 gene, herein designated GAM GENE, on one or more GAM816 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11302] It is yet further appreciated that specific functions, and accordingly utilities, of GAM816 correlate with, and may be deduced from, the identity of the target genes which GAM816 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11303] Nucleotide sequences of the GAM816 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM816 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM816 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM816 are further described hereinbelow with reference to Table 1.

[11304] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM816 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11305] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 817 (GAM817) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11306] GAM817 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM817 was detected is

described hereinabove with reference to Figs. 2-8.

[11307] GAM817 gene, herein designated GAM GENE, and GAM817 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11308] GAM817 gene, herein designated GAM GENE, encodes a GAM817 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM817 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM817 precursor RNA is designated SEQ ID:794, and is provided hereinbelow with reference to the sequence listing part.

[11309] GAM817 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM817 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11310] An enzyme complex designated DICER COMPLEX, dices the GAM817 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM817 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of GAM817 RNA is designated SEQ ID:3398, and is provided hereinbelow with reference to the sequence listing part.

[11311] GAM817 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM817 target RNA, herein designated GAM TARGET RNA. GAM817 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11312] GAM817 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM817 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM817 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM817 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM817 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11313] The complementary binding of GAM817 RNA, herein designated GAM RNA, to target binding sites on GAM817 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM817 target RNA, herein designated GAM TARGET RNA, into GAM817 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11314] It is appreciated that GAM817 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM817 target genes. The mRNA of each one of this plurality of GAM817 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM817 RNA, herein designated GAM RNA, and which when bound by GAM817 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM817 target proteins.

[11315] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM817 gene, herein designated GAM GENE, on one or more GAM817 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11316] It is yet further appreciated that specific functions, and accordingly utilities, of GAM817 correlate with, and may be deduced from, the identity of the target genes which GAM817 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11317] Nucleotide sequences of the GAM817 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM817 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM817 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM817 are further described hereinbelow with reference to Table 1.

[11318] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM817 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11319] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 818 (GAM818) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11320] GAM818 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM818 was detected is described hereinabove with reference to Figs. 2-8.

[11321] GAM818 gene, herein designated GAM GENE, and GAM818 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11322] GAM818 gene, herein designated GAM GENE, encodes a GAM818 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM818 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM818 precursor RNA is designated SEQ ID:795, and is provided hereinbelow with reference to the sequence listing part.

[11323] GAM818 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM818 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11324] An enzyme complex designated DICER COMPLEX, dices the GAM818 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM818 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM818 RNA is designated SEQ ID:3395, and is provided hereinbelow with reference to the sequence listing part.

[11325] GAM818 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM818 target RNA, herein designated GAM TARGET RNA. GAM818 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11326] GAM818 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM818 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM818 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM818 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM818 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11327] The complementary binding of GAM818 RNA, herein designated GAM RNA, to target binding sites on GAM818 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM818 target RNA, herein designated GAM TARGET RNA, into GAM818 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11328] It is appreciated that GAM818 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM818 target genes. The mRNA of each one of this plurality of GAM818 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM818 RNA, herein designated GAM RNA, and which when bound by GAM818 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM818 target proteins.

[11329] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM818 gene, herein designated GAM GENE, on one or more GAM818 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11330] It is yet further appreciated that specific functions, and accordingly utilities, of GAM818 correlate with, and may be deduced from, the identity of the target genes which GAM818 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11331] Nucleotide sequences of the GAM818 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM818 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM818 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM818 are further described hereinbelow with reference to Table 1.

[11332] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM818 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11333] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 819 (GAM819) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11334] GAM819 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM819 was detected is described hereinabove with reference to Figs. 2-8.

[11335] GAM819 gene, herein designated GAM GENE, and GAM819 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11336] GAM819 gene, herein designated GAM GENE, encodes a GAM819 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM819 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM819 precursor RNA is designated SEQ ID:796, and is provided hereinbelow with reference to the sequence listing part.

[11337] GAM819 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM819 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11338] An enzyme complex designated DICER COMPLEX, dices the GAM819 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM819 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM819 RNA is designated SEQ ID:3396, and is provided hereinbelow with reference to the sequence listing part.

[11339] GAM819 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM819 target RNA, herein designated GAM TARGET RNA. GAM819 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11340] GAM819 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM819 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM819 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM819 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM819 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11341] The complementary binding of GAM819 RNA, herein designated GAM RNA, to target binding sites on GAM819 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM819 target RNA, herein designated GAM TARGET RNA, into GAM819 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11342] It is appreciated that GAM819 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM819 target genes. The mRNA of each one of this plurality of GAM819 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM819 RNA, herein designated GAM RNA, and which when bound by GAM819 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM819 target proteins.

[11343] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM819 gene, herein designated GAM GENE, on one or more

GAM819 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11344] It is yet further appreciated that specific functions, and accordingly utilities, of GAM819 correlate with, and may be deduced from, the identity of the target genes which GAM819 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11345] Nucleotide sequences of the GAM819 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM819 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM819 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM819 are further described hereinbelow with reference to Table 1.

[11346] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM819 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11347] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 820 (GAM820) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11348] GAM820 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM820 was detected is described hereinabove with reference to Figs. 2-8.

[11349] GAM820 gene, herein designated GAM GENE, and GAM820 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11350] GAM820 gene, herein designated GAM GENE, encodes a GAM820 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM820 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM820 precursor RNA is designated SEQ ID:797, and is provided hereinbelow with reference to the sequence listing part.

[11351] GAM820 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM820 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11352] An enzyme complex designated DICER COMPLEX, dices the GAM820 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM820 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM820 RNA is designated SEQ ID:3399, and is provided hereinbelow with reference to the sequence listing part.

[11353] GAM820 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM820 target RNA, herein designated GAM TARGET RNA. GAM820 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11354] GAM820 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM820 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM820 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM820 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM820 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11355] The complementary binding of GAM820 RNA, herein designated GAM RNA, to target binding sites on GAM820 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM820 target RNA, herein designated GAM TARGET RNA, into GAM820 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11356] It is appreciated that GAM820 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM820 target genes. The mRNA of each one of this plurality of GAM820 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM820 RNA, herein designated GAM RNA, and which when bound by GAM820 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM820 target proteins.

[11357] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM820 gene, herein designated GAM GENE, on one or more GAM820 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11358] It is yet further appreciated that specific functions, and accordingly utilities, of GAM820 correlate with, and may be deduced from, the identity of the target genes which GAM820 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11359] Nucleotide sequences of the GAM820 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM820 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM820 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM820 are further described hereinbelow with reference to Table 1.

[11360] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM820 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11361] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 821 (GAM821) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11362] GAM821 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM821 was detected is described hereinabove with reference to Figs. 2-8.

[11363] GAM821 gene, herein designated GAM GENE, and GAM821 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11364] GAM821 gene, herein designated GAM GENE, encodes a GAM821 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM821 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM821 precursor RNA is designated SEQ ID:798, and is provided hereinbelow with reference to the sequence listing part.

[11365] GAM821 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM821 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11366] An enzyme complex designated DICER COMPLEX, dices the GAM821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM821 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM821 RNA is designated SEQ ID:3400, and is provided hereinbelow with reference to the sequence listing part.

[11367] GAM821 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM821 target RNA, herein designated GAM TARGET RNA. GAM821 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11368] GAM821 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM821

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM821 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM821 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM821 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11369] The complementary binding of GAM821 RNA, herein designated GAM RNA, to target binding sites on GAM821 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM821 target RNA, herein designated GAM TARGET RNA, into GAM821 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11370] It is appreciated that GAM821 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM821 target genes. The mRNA of each one of this plurality of GAM821 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM821 RNA, herein designated GAM RNA, and which when bound by GAM821 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM821 target proteins.

[11371] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM821 gene, herein designated GAM GENE, on one or more GAM821 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11372] It is yet further appreciated that specific functions, and accordingly utilities, of GAM821 correlate with, and may be deduced from, the identity of the target genes which GAM821 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11373] Nucleotide sequences of the GAM821 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM821 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM821 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM821 are further described hereinbelow with

reference to Table 1.

[11374] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM821 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11375] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 822 (GAM822) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11376] GAM822 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM822 was detected is described hereinabove with reference to Figs. 2-8.

[11377] GAM822 gene, herein designated GAM GENE, and GAM822 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11378] GAM822 gene, herein designated GAM GENE, encodes a GAM822 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM822 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM822 precursor RNA is designated SEQ ID:799, and is provided

hereinbelow with reference to the sequence listing part.

[11379] GAM822 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM822 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11380] An enzyme complex designated DICER COMPLEX, dices the GAM822 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM822 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM822 RNA is designated SEQ ID:3401, and is provided hereinbelow with reference to the sequence listing part.

[11381] GAM822 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM822 target RNA, herein designated GAM TARGET RNA. GAM822 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[11382] GAM822 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM822 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM822 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM822 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM822 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11383] The complementary binding of GAM822 RNA, herein designated GAM RNA, to target binding sites on GAM822 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM822 target RNA, herein designated GAM TARGET RNA, into GAM822 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11384] It is appreciated that GAM822 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM822 target genes. The mRNA of each one of this plurality of GAM822 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM822 RNA, herein designated GAM RNA, and which when bound by GAM822 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM822 target proteins.

[11385] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM822 gene, herein designated GAM GENE, on one or more GAM822 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11386] It is yet further appreciated that specific functions, and accordingly utilities, of GAM822 correlate with, and may be deduced from, the identity of the target genes which GAM822 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11387] Nucleotide sequences of the GAM822 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM822 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM822 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM822 are further described hereinbelow with reference to Table 1.

[11388] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM822 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11389] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 823 (GAM823) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11390] GAM823 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM823 was detected is described hereinabove with reference to Figs. 2-8.

[11391] GAM823 gene, herein designated GAM GENE, and GAM823 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11392] GAM823 gene, herein designated GAM GENE, encodes a GAM823 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM823 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM823 precursor RNA is designated SEQ ID:800, and is provided hereinbelow with reference to the sequence listing part.

[11393] GAM823 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM823 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11394] An enzyme complex designated DICER COMPLEX, dices the GAM823 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM823 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM823 RNA is designated SEQ ID:3402, and is provided hereinbelow with reference to the sequence listing part.

[11395] GAM823 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM823 target RNA, herein designated

GAM TARGET RNA. GAM823 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11396] GAM823 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM823 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM823 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM823 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM823 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11397] The complementary binding of GAM823 RNA, herein designated GAM RNA, to target binding sites on GAM823 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM823 target RNA, herein designated GAM

TARGET RNA, into GAM823 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11398] It is appreciated that GAM823 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM823 target genes. The mRNA of each one of this plurality of GAM823 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM823 RNA, herein designated GAM RNA, and which when bound by GAM823 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM823 target proteins.

[11399] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM823 gene, herein designated GAM GENE, on one or more GAM823 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11400] It is yet further appreciated that specific functions, and accordingly utilities, of GAM823 correlate with, and may be deduced from, the identity of the target

genes which GAM823 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11401] Nucleotide sequences of the GAM823 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM823 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM823 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM823 are further described hereinbelow with reference to Table 1.

[11402] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM823 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11403] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 824 (GAM824) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11404] GAM824 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM824 was detected is described hereinabove with reference to Figs. 2-8.

[11405] GAM824 gene, herein designated GAM GENE, and GAM824 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[11406] GAM824 gene, herein designated GAM GENE, encodes a GAM824 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM824 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM824 precursor RNA is designated SEQ ID:801, and is provided hereinbelow with reference to the sequence listing part.

[11407] GAM824 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM824 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11408] An enzyme complex designated DICER COMPLEX, dices the GAM824 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM824 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM824 RNA is designated SEQ ID:3403, and is provided

hereinbelow with reference to the sequence listing part.

[11409] GAM824 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM824 target RNA, herein designated GAM TARGET RNA. GAM824 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11410] GAM824 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM824 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM824 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM824 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM824 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11411] The complementary binding of GAM824 RNA, herein designated GAM RNA, to target binding sites on GAM824 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM824 target RNA, herein designated GAM TARGET RNA, into GAM824 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11412] It is appreciated that GAM824 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM824 target genes. The mRNA of each one of this plurality of GAM824 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM824 RNA, herein designated GAM RNA, and which when bound by GAM824 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM824 target proteins.

[11413] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM824 gene, herein designated GAM GENE, on one or more GAM824 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11414] It is yet further appreciated that specific functions, and accordingly utilities, of GAM824 correlate with, and may be deduced from, the identity of the target genes which GAM824 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11415] Nucleotide sequences of the GAM824 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM824 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM824 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM824 are further described hereinbelow with reference to Table 1.

[11416] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM824 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11417] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 825 (GAM825) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11418] GAM825 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM825 was detected is

described hereinabove with reference to Figs. 2-8.

[11419] GAM825 gene, herein designated GAM GENE, and GAM825 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11420] GAM825 gene, herein designated GAM GENE, encodes a GAM825 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM825 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM825 precursor RNA is designated SEQ ID:802, and is provided hereinbelow with reference to the sequence listing part.

[11421] GAM825 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM825 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11422] An enzyme complex designated DICER COMPLEX, dices the GAM825 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM825 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM825 RNA is designated SEQ ID:3404, and is provided hereinbelow with reference to the sequence listing part.

[11423] GAM825 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM825 target RNA, herein designated GAM TARGET RNA. GAM825 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11424] GAM825 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM825 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM825 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM825 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM825 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11425] The complementary binding of GAM825 RNA, herein designated GAM RNA, to target binding sites on GAM825 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM825 target RNA, herein designated GAM TARGET RNA, into GAM825 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11426] It is appreciated that GAM825 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM825 target genes. The mRNA of each one of this plurality of GAM825 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM825 RNA, herein designated GAM RNA, and which when bound by GAM825 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM825 target proteins.

[11427] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM825 gene, herein designated GAM GENE, on one or more GAM825 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11428] It is yet further appreciated that specific functions, and accordingly utilities, of GAM825 correlate with, and may be deduced from, the identity of the target genes which GAM825 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11429] Nucleotide sequences of the GAM825 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM825 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM825 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM825 are further described hereinbelow with reference to Table 1.

[11430] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM825 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11431] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 826 (GAM826) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11432] GAM826 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM826 was detected is described hereinabove with reference to Figs. 2-8.

[11433] GAM826 gene, herein designated GAM GENE, and GAM826 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11434] GAM826 gene, herein designated GAM GENE, encodes a GAM826 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM826 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM826 precursor RNA is designated SEQ ID:803, and is provided hereinbelow with reference to the sequence listing part.

[11435] GAM826 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM826 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11436] An enzyme complex designated DICER COMPLEX, dices the GAM826 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM826 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM826 RNA is designated SEQ ID:3405, and is provided hereinbelow with reference to the sequence listing part.

[11437] GAM826 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM826 target RNA, herein designated GAM TARGET RNA. GAM826 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11438] GAM826 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM826 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM826 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM826 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM826 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11439] The complementary binding of GAM826 RNA, herein designated GAM RNA, to target binding sites on GAM826 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM826 target RNA, herein designated GAM TARGET RNA, into GAM826 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11440] It is appreciated that GAM826 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM826 target genes. The mRNA of each one of this plurality of GAM826 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM826 RNA, herein designated GAM RNA, and which when bound by GAM826 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM826 target proteins.

[11441] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM826 gene, herein designated GAM GENE, on one or more GAM826 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11442] It is yet further appreciated that specific functions, and accordingly utilities, of GAM826 correlate with, and may be deduced from, the identity of the target genes which GAM826 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11443] Nucleotide sequences of the GAM826 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM826 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM826 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM826 are further described hereinbelow with reference to Table 1.

[11444] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM826 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11445] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 827 (GAM827) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11446] GAM827 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM827 was detected is described hereinabove with reference to Figs. 2-8.

[11447] GAM827 gene, herein designated GAM GENE, and GAM827 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11448] GAM827 gene, herein designated GAM GENE, encodes a GAM827 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM827 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM827 precursor RNA is designated SEQ ID:804, and is provided hereinbelow with reference to the sequence listing part.

[11449] GAM827 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM827 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11450] An enzyme complex designated DICER COMPLEX, dices the GAM827 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM827 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of GAM827 RNA is designated SEQ ID:3406, and is provided hereinbelow with reference to the sequence listing part.

[11451] GAM827 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM827 target RNA, herein designated GAM TARGET RNA. GAM827 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11452] GAM827 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM827 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM827 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM827 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM827 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11453] The complementary binding of GAM827 RNA, herein designated GAM RNA, to target binding sites on GAM827 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM827 target RNA, herein designated GAM TARGET RNA, into GAM827 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11454] It is appreciated that GAM827 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM827 target genes. The mRNA of each one of this plurality of GAM827 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM827 RNA, herein designated GAM RNA, and which when bound by GAM827 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM827 target proteins.

[11455] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM827 gene, herein designated GAM GENE, on one or more

GAM827 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11456] It is yet further appreciated that specific functions, and accordingly utilities, of GAM827 correlate with, and may be deduced from, the identity of the target genes which GAM827 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11457] Nucleotide sequences of the GAM827 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM827 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM827 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM827 are further described hereinbelow with reference to Table 1.

[11458] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM827 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11459] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 828 (GAM828) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11460] GAM828 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM828 was detected is described hereinabove with reference to Figs. 2-8.

[11461] GAM828 gene, herein designated GAM GENE, and GAM828 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11462] GAM828 gene, herein designated GAM GENE, encodes a GAM828 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM828 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM828 precursor RNA is designated SEQ ID:805, and is provided hereinbelow with reference to the sequence listing part.

[11463] GAM828 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM828 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11464] An enzyme complex designated DICER COMPLEX, dices the GAM828 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM828 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM828 RNA is designated SEQ ID:3407, and is provided hereinbelow with reference to the sequence listing part.

[11465] GAM828 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM828 target RNA, herein designated GAM TARGET RNA. GAM828 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11466] GAM828 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM828 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM828 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM828 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM828 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11467] The complementary binding of GAM828 RNA, herein designated GAM RNA, to target binding sites on GAM828 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM828 target RNA, herein designated GAM TARGET RNA, into GAM828 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11468] It is appreciated that GAM828 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM828 target genes. The mRNA of each one of this plurality of GAM828 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM828 RNA, herein designated GAM RNA, and which when bound by GAM828 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM828 target proteins.

[11469] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM828 gene, herein designated GAM GENE, on one or more GAM828 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11470] It is yet further appreciated that specific functions, and accordingly utilities, of GAM828 correlate with, and may be deduced from, the identity of the target genes which GAM828 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11471] Nucleotide sequences of the GAM828 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM828 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM828 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM828 are further described hereinbelow with reference to Table 1.

[11472] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM828 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11473] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 829 (GAM829) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11474] GAM829 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM829 was detected is described hereinabove with reference to Figs. 2-8.

[11475] GAM829 gene, herein designated GAM GENE, and GAM829 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11476] GAM829 gene, herein designated GAM GENE, encodes a GAM829 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM829 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM829 precursor RNA is designated SEQ ID:806, and is provided hereinbelow with reference to the sequence listing part.

[11477] GAM829 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM829 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11478] An enzyme complex designated DICER COMPLEX, dices the GAM829 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM829 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM829 RNA is designated SEQ ID:3408, and is provided hereinbelow with reference to the sequence listing part.

[11479] GAM829 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM829 target RNA, herein designated GAM TARGET RNA. GAM829 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11480] GAM829 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM829

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM829 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM829 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM829 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11481] The complementary binding of GAM829 RNA, herein designated GAM RNA, to target binding sites on GAM829 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM829 target RNA, herein designated GAM TARGET RNA, into GAM829 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11482] It is appreciated that GAM829 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM829 target genes. The mRNA of each one of this plurality of GAM829 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM829 RNA, herein designated GAM RNA, and which when bound by GAM829 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM829 target proteins.

[11483] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM829 gene, herein designated GAM GENE, on one or more GAM829 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11484] It is yet further appreciated that specific functions, and accordingly utilities, of GAM829 correlate with, and may be deduced from, the identity of the target genes which GAM829 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11485] Nucleotide sequences of the GAM829 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM829 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM829 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM829 are further described hereinbelow with

reference to Table 1.

[11486] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM829 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11487] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 830 (GAM830) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11488] GAM830 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM830 was detected is described hereinabove with reference to Figs. 2-8.

[11489] GAM830 gene, herein designated GAM GENE, and GAM830 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11490] GAM830 gene, herein designated GAM GENE, encodes a GAM830 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM830 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM830 precursor RNA is designated SEQ ID:807, and is provided

hereinbelow with reference to the sequence listing part.

[11491] GAM830 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM830 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11492] An enzyme complex designated DICER COMPLEX, dices the GAM830 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM830 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM830 RNA is designated SEQ ID:3409, and is provided hereinbelow with reference to the sequence listing part.

[11493] GAM830 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM830 target RNA, herein designated GAM TARGET RNA. GAM830 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[11494] GAM830 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM830 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM830 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM830 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM830 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11495] The complementary binding of GAM830 RNA, herein designated GAM RNA, to target binding sites on GAM830 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM830 target RNA, herein designated GAM TARGET RNA, into GAM830 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11496] It is appreciated that GAM830 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM830 target genes. The mRNA of each one of this plurality of GAM830 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM830 RNA, herein designated GAM RNA, and which when bound by GAM830 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM830 target proteins.

[11497] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM830 gene, herein designated GAM GENE, on one or more GAM830 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11498] It is yet further appreciated that specific functions, and accordingly utilities, of GAM830 correlate with, and may be deduced from, the identity of the target genes which GAM830 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11499] Nucleotide sequences of the GAM830 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM830 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM830 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM830 are further described hereinbelow with reference to Table 1.

[11500] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM830 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11501] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 831 (GAM831) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11502] GAM831 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM831 was detected is described hereinabove with reference to Figs. 2-8.

[11503] GAM831 gene, herein designated GAM GENE, and GAM831 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11504] GAM831 gene, herein designated GAM GENE, encodes a GAM831 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM831 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM831 precursor RNA is designated SEQ ID:808, and is provided hereinbelow with reference to the sequence listing part.

[11505] GAM831 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM831 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11506] An enzyme complex designated DICER COMPLEX, dices the GAM831 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM831 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM831 RNA is designated SEQ ID:3410, and is provided hereinbelow with reference to the sequence listing part.

[11507] GAM831 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM831 target RNA, herein designated

GAM TARGET RNA. GAM831 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11508] GAM831 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM831 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM831 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM831 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM831 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11509] The complementary binding of GAM831 RNA, herein designated GAM RNA, to target binding sites on GAM831 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM831 target RNA, herein designated GAM

TARGET RNA, into GAM831 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11510] It is appreciated that GAM831 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM831 target genes. The mRNA of each one of this plurality of GAM831 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM831 RNA, herein designated GAM RNA, and which when bound by GAM831 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM831 target proteins.

[11511] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM831 gene, herein designated GAM GENE, on one or more GAM831 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11512] It is yet further appreciated that specific functions, and accordingly utilities, of GAM831 correlate with, and may be deduced from, the identity of the target

genes which GAM831 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11513] Nucleotide sequences of the GAM831 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM831 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM831 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM831 are further described hereinbelow with reference to Table 1.

[11514] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM831 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11515] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 832 (GAM832) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11516] GAM832 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM832 was detected is described hereinabove with reference to Figs. 2-8.

[11517] GAM832 gene, herein designated GAM GENE, and GAM832 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[11518] GAM832 gene, herein designated GAM GENE, encodes a GAM832 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM832 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM832 precursor RNA is designated SEQ ID:809, and is provided hereinbelow with reference to the sequence listing part.

[11519] GAM832 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM832 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11520] An enzyme complex designated DICER COMPLEX, dices the GAM832 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM832 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM832 RNA is designated SEQ ID:3411, and is provided

hereinbelow with reference to the sequence listing part.

[11521] GAM832 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM832 target RNA, herein designated GAM TARGET RNA. GAM832 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11522] GAM832 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM832 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM832 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM832 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM832 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11523] The complementary binding of GAM832 RNA, herein designated GAM RNA, to target binding sites on GAM832 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM832 target RNA, herein designated GAM TARGET RNA, into GAM832 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11524] It is appreciated that GAM832 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM832 target genes. The mRNA of each one of this plurality of GAM832 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM832 RNA, herein designated GAM RNA, and which when bound by GAM832 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM832 target proteins.

[11525] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM832 gene, herein designated GAM GENE, on one or more GAM832 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11526] It is yet further appreciated that specific functions, and accordingly utilities, of GAM832 correlate with, and may be deduced from, the identity of the target genes which GAM832 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11527] Nucleotide sequences of the GAM832 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM832 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM832 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM832 are further described hereinbelow with reference to Table 1.

[11528] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM832 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11529] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 833 (GAM833) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11530] GAM833 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM833 was detected is

described hereinabove with reference to Figs. 2-8.

[11531] GAM833 gene, herein designated GAM GENE, and GAM833 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11532] GAM833 gene, herein designated GAM GENE, encodes a GAM833 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM833 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM833 precursor RNA is designated SEQ ID:810, and is provided hereinbelow with reference to the sequence listing part.

[11533] GAM833 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM833 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11534] An enzyme complex designated DICER COMPLEX, dices the GAM833 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM833 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM833 RNA is designated SEQ ID:3412, and is provided hereinbelow with reference to the sequence listing part.

[11535] GAM833 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM833 target RNA, herein designated GAM TARGET RNA. GAM833 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11536] GAM833 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM833 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM833 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM833 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM833 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11537] The complementary binding of GAM833 RNA, herein designated GAM RNA, to target binding sites on GAM833 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM833 target RNA, herein designated GAM TARGET RNA, into GAM833 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11538] It is appreciated that GAM833 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM833 target genes. The mRNA of each one of this plurality of GAM833 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM833 RNA, herein designated GAM RNA, and which when bound by GAM833 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM833 target proteins.

[11539] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM833 gene, herein designated GAM GENE, on one or more GAM833 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11540] It is yet further appreciated that specific functions, and accordingly utilities, of GAM833 correlate with, and may be deduced from, the identity of the target genes which GAM833 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11541] Nucleotide sequences of the GAM833 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM833 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM833 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM833 are further described hereinbelow with reference to Table 1.

[11542] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM833 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11543] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 834 (GAM834) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11544] GAM834 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM834 was detected is described hereinabove with reference to Figs. 2-8.

[11545] GAM834 gene, herein designated GAM GENE, and GAM834 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11546] GAM834 gene, herein designated GAM GENE, encodes a GAM834 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM834 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM834 precursor RNA is designated SEQ ID:811, and is provided hereinbelow with reference to the sequence listing part.

[11547] GAM834 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM834 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11548] An enzyme complex designated DICER COMPLEX, dices the GAM834 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM834 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM834 RNA is designated SEQ ID:3413, and is provided hereinbelow with reference to the sequence listing part.

[11549] GAM834 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM834 target RNA, herein designated GAM TARGET RNA. GAM834 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11550] GAM834 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM834 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM834 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM834 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM834 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11551] The complementary binding of GAM834 RNA, herein designated GAM RNA, to target binding sites on GAM834 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM834 target RNA, herein designated GAM TARGET RNA, into GAM834 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11552] It is appreciated that GAM834 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM834 target genes. The mRNA of each one of this plurality of GAM834 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM834 RNA, herein designated GAM RNA, and which when bound by GAM834 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM834 target proteins.

[11553] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM834 gene, herein designated GAM GENE, on one or more GAM834 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11554] It is yet further appreciated that specific functions, and accordingly utilities, of GAM834 correlate with, and may be deduced from, the identity of the target genes which GAM834 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11555] Nucleotide sequences of the GAM834 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM834 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM834 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM834 are further described hereinbelow with reference to Table 1.

[11556] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM834 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11557] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 835 (GAM835) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11558] GAM835 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM835 was detected is described hereinabove with reference to Figs. 2-8.

[11559] GAM835 gene, herein designated GAM GENE, and GAM835 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11560] GAM835 gene, herein designated GAM GENE, encodes a GAM835 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM835 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM835 precursor RNA is designated SEQ ID:812, and is provided hereinbelow with reference to the sequence listing part.

[11561] GAM835 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM835 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11562] An enzyme complex designated DICER COMPLEX, dices the GAM835 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM835 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM835 RNA is designated SEQ ID:3415, and is provided hereinbelow with reference to the sequence listing part.

[11563] GAM835 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM835 target RNA, herein designated GAM TARGET RNA. GAM835 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11564] GAM835 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM835 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM835 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM835 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM835 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11565] The complementary binding of GAM835 RNA, herein designated GAM RNA, to target binding sites on GAM835 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM835 target RNA, herein designated GAM TARGET RNA, into GAM835 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11566] It is appreciated that GAM835 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM835 target genes. The mRNA of each one of this plurality of GAM835 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM835 RNA, herein designated GAM RNA, and which when bound by GAM835 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM835 target proteins.

[11567] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM835 gene, herein designated GAM GENE, on one or more

GAM835 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11568] It is yet further appreciated that specific functions, and accordingly utilities, of GAM835 correlate with, and may be deduced from, the identity of the target genes which GAM835 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11569] Nucleotide sequences of the GAM835 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM835 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM835 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM835 are further described hereinbelow with reference to Table 1.

[11570] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM835 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11571] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 836 (GAM836) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11572] GAM836 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM836 was detected is described hereinabove with reference to Figs. 2-8.

[11573] GAM836 gene, herein designated GAM GENE, and GAM836 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11574] GAM836 gene, herein designated GAM GENE, encodes a GAM836 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM836 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM836 precursor RNA is designated SEQ ID:813, and is provided hereinbelow with reference to the sequence listing part.

[11575] GAM836 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM836 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11576] An enzyme complex designated DICER COMPLEX, dices the GAM836 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM836 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM836 RNA is designated SEQ ID:3414, and is provided hereinbelow with reference to the sequence listing part.

[11577] GAM836 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM836 target RNA, herein designated GAM TARGET RNA. GAM836 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11578] GAM836 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM836 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM836 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM836 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM836 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11579] The complementary binding of GAM836 RNA, herein designated GAM RNA, to target binding sites on GAM836 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM836 target RNA, herein designated GAM TARGET RNA, into GAM836 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11580] It is appreciated that GAM836 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM836 target genes. The mRNA of each one of this plurality of GAM836 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM836 RNA, herein designated GAM RNA, and which when bound by GAM836 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM836 target proteins.

[11581] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM836 gene, herein designated GAM GENE, on one or more GAM836 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11582] It is yet further appreciated that specific functions, and accordingly utilities, of GAM836 correlate with, and may be deduced from, the identity of the target genes which GAM836 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11583] Nucleotide sequences of the GAM836 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM836 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM836 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM836 are further described hereinbelow with reference to Table 1.

[11584] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM836 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11585] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 837 (GAM837) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11586] GAM837 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM837 was detected is described hereinabove with reference to Figs. 2-8.

[11587] GAM837 gene, herein designated GAM GENE, and GAM837 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11588] GAM837 gene, herein designated GAM GENE, encodes a GAM837 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM837 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM837 precursor RNA is designated SEQ ID:814, and is provided hereinbelow with reference to the sequence listing part.

[11589] GAM837 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM837 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11590] An enzyme complex designated DICER COMPLEX, dices the GAM837 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM837 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM837 RNA is designated SEQ ID:3416, and is provided hereinbelow with reference to the sequence listing part.

[11591] GAM837 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM837 target RNA, herein designated GAM TARGET RNA. GAM837 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11592] GAM837 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM837

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM837 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM837 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM837 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11593] The complementary binding of GAM837 RNA, herein designated GAM RNA, to target binding sites on GAM837 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM837 target RNA, herein designated GAM TARGET RNA, into GAM837 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11594] It is appreciated that GAM837 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM837 target genes. The mRNA of each one of this plurality of GAM837 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM837 RNA, herein designated GAM RNA, and which when bound by GAM837 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM837 target proteins.

[11595] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM837 gene, herein designated GAM GENE, on one or more GAM837 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11596] It is yet further appreciated that specific functions, and accordingly utilities, of GAM837 correlate with, and may be deduced from, the identity of the target genes which GAM837 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11597] Nucleotide sequences of the GAM837 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM837 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM837 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM837 are further described hereinbelow with

reference to Table 1.

[11598] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM837 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11599] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 838 (GAM838) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11600] GAM838 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM838 was detected is described hereinabove with reference to Figs. 2-8.

[11601] GAM838 gene, herein designated GAM GENE, and GAM838 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11602] GAM838 gene, herein designated GAM GENE, encodes a GAM838 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM838 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM838 precursor RNA is designated SEQ ID:815, and is provided

hereinbelow with reference to the sequence listing part.

[11603] GAM838 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM838 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11604] An enzyme complex designated DICER COMPLEX, dices the GAM838 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM838 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM838 RNA is designated SEQ ID:3417, and is provided hereinbelow with reference to the sequence listing part.

[11605] GAM838 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM838 target RNA, herein designated GAM TARGET RNA. GAM838 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[11606] GAM838 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM838 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM838 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM838 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM838 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11607] The complementary binding of GAM838 RNA, herein designated GAM RNA, to target binding sites on GAM838 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM838 target RNA, herein designated GAM TARGET RNA, into GAM838 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11608] It is appreciated that GAM838 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM838 target genes. The mRNA of each one of this plurality of GAM838 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM838 RNA, herein designated GAM RNA, and which when bound by GAM838 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM838 target proteins.

[11609] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM838 gene, herein designated GAM GENE, on one or more GAM838 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11610] It is yet further appreciated that specific functions, and accordingly utilities, of GAM838 correlate with, and may be deduced from, the identity of the target genes which GAM838 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11611] Nucleotide sequences of the GAM838 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM838 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM838 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM838 are further described hereinbelow with reference to Table 1.

[11612] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM838 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11613] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 839 (GAM839) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11614] GAM839 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM839 was detected is described hereinabove with reference to Figs. 2-8.

[11615] GAM839 gene, herein designated GAM GENE, and GAM839 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11616] GAM839 gene, herein designated GAM GENE, encodes a GAM839 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM839 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM839 precursor RNA is designated SEQ ID:816, and is provided hereinbelow with reference to the sequence listing part.

[11617] GAM839 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM839 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11618] An enzyme complex designated DICER COMPLEX, dices the GAM839 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM839 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM839 RNA is designated SEQ ID:3418, and is provided hereinbelow with reference to the sequence listing part.

[11619] GAM839 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM839 target RNA, herein designated

GAM TARGET RNA. GAM839 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11620] GAM839 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM839 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM839 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM839 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM839 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11621] The complementary binding of GAM839 RNA, herein designated GAM RNA, to target binding sites on GAM839 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM839 target RNA, herein designated GAM

TARGET RNA, into GAM839 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11622] It is appreciated that GAM839 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM839 target genes. The mRNA of each one of this plurality of GAM839 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM839 RNA, herein designated GAM RNA, and which when bound by GAM839 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM839 target proteins.

[11623] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM839 gene, herein designated GAM GENE, on one or more GAM839 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11624] It is yet further appreciated that specific functions, and accordingly utilities, of GAM839 correlate with, and may be deduced from, the identity of the target

genes which GAM839 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11625] Nucleotide sequences of the GAM839 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM839 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM839 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM839 are further described hereinbelow with reference to Table 1.

[11626] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM839 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11627] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 840 (GAM840) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11628] GAM840 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM840 was detected is described hereinabove with reference to Figs. 2-8.

[11629] GAM840 gene, herein designated GAM GENE, and GAM840 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[11630] GAM840 gene, herein designated GAM GENE, encodes a GAM840 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM840 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM840 precursor RNA is designated SEQ ID:817, and is provided hereinbelow with reference to the sequence listing part.

[11631] GAM840 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM840 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11632] An enzyme complex designated DICER COMPLEX, dices the GAM840 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM840 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM840 RNA is designated SEQ ID:3419, and is provided

hereinbelow with reference to the sequence listing part.

[11633] GAM840 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM840 target RNA, herein designated GAM TARGET RNA. GAM840 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11634] GAM840 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM840 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM840 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM840 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM840 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11635] The complementary binding of GAM840 RNA, herein designated GAM RNA, to target binding sites on GAM840 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM840 target RNA, herein designated GAM TARGET RNA, into GAM840 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11636] It is appreciated that GAM840 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM840 target genes. The mRNA of each one of this plurality of GAM840 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM840 RNA, herein designated GAM RNA, and which when bound by GAM840 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM840 target proteins.

[11637] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM840 gene, herein designated GAM GENE, on one or more GAM840 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11638] It is yet further appreciated that specific functions, and accordingly utilities, of GAM840 correlate with, and may be deduced from, the identity of the target genes which GAM840 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11639] Nucleotide sequences of the GAM840 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM840 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM840 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM840 are further described hereinbelow with reference to Table 1.

[11640] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM840 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11641] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 841 (GAM841) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11642] GAM841 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM841 was detected is

described hereinabove with reference to Figs. 2-8.

[11643] GAM841 gene, herein designated GAM GENE, and GAM841 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11644] GAM841 gene, herein designated GAM GENE, encodes a GAM841 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM841 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM841 precursor RNA is designated SEQ ID:818, and is provided hereinbelow with reference to the sequence listing part.

[11645] GAM841 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM841 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11646] An enzyme complex designated DICER COMPLEX, dices the GAM841 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM841 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM841 RNA is designated SEQ ID:3420, and is provided hereinbelow with reference to the sequence listing part.

[11647] GAM841 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM841 target RNA, herein designated GAM TARGET RNA. GAM841 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11648] GAM841 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM841 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM841 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM841 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM841 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11649] The complementary binding of GAM841 RNA, herein designated GAM RNA, to target binding sites on GAM841 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM841 target RNA, herein designated GAM TARGET RNA, into GAM841 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11650] It is appreciated that GAM841 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM841 target genes. The mRNA of each one of this plurality of GAM841 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM841 RNA, herein designated GAM RNA, and which when bound by GAM841 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM841 target proteins.

[11651] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM841 gene, herein designated GAM GENE, on one or more GAM841 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11652] It is yet further appreciated that specific functions, and accordingly utilities, of GAM841 correlate with, and may be deduced from, the identity of the target genes which GAM841 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11653] Nucleotide sequences of the GAM841 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM841 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM841 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM841 are further described hereinbelow with reference to Table 1.

[11654] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM841 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11655] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 842 (GAM842) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11656] GAM842 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM842 was detected is described hereinabove with reference to Figs. 2-8.

[11657] GAM842 gene, herein designated GAM GENE, and GAM842 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11658] GAM842 gene, herein designated GAM GENE, encodes a GAM842 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM842 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM842 precursor RNA is designated SEQ ID:819, and is provided hereinbelow with reference to the sequence listing part.

[11659] GAM842 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11660] An enzyme complex designated DICER COMPLEX, dices the GAM842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM842 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM842 RNA is designated SEQ ID:3421, and is provided hereinbelow with reference to the sequence listing part.

[11661] GAM842 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM842 target RNA, herein designated GAM TARGET RNA. GAM842 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11662] GAM842 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM842 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM842 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM842 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM842 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11663] The complementary binding of GAM842 RNA, herein designated GAM RNA, to target binding sites on GAM842 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM842 target RNA, herein designated GAM TARGET RNA, into GAM842 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11664] It is appreciated that GAM842 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM842 target genes. The mRNA of each one of this plurality of GAM842 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM842 RNA, herein designated GAM RNA, and which when bound by GAM842 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM842 target proteins.

[11665] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM842 gene, herein designated GAM GENE, on one or more GAM842 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11666] It is yet further appreciated that specific functions, and accordingly utilities, of GAM842 correlate with, and may be deduced from, the identity of the target genes which GAM842 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11667] Nucleotide sequences of the GAM842 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM842 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM842 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM842 are further described hereinbelow with reference to Table 1.

[11668] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM842 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11669] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 843 (GAM843) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11670] GAM843 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM843 was detected is described hereinabove with reference to Figs. 2-8.

[11671] GAM843 gene, herein designated GAM GENE, and GAM843 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11672] GAM843 gene, herein designated GAM GENE, encodes a GAM843 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM843 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM843 precursor RNA is designated SEQ ID:820, and is provided hereinbelow with reference to the sequence listing part.

[11673] GAM843 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM843 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11674] An enzyme complex designated DICER COMPLEX, dices the GAM843 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM843 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM843 RNA is designated SEQ ID:3422, and is provided hereinbelow with reference to the sequence listing part.

[11675] GAM843 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM843 target RNA, herein designated GAM TARGET RNA. GAM843 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11676] GAM843 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM843 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM843 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM843 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM843 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11677] The complementary binding of GAM843 RNA, herein designated GAM RNA, to target binding sites on GAM843 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM843 target RNA, herein designated GAM TARGET RNA, into GAM843 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11678] It is appreciated that GAM843 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM843 target genes. The mRNA of each one of this plurality of GAM843 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM843 RNA, herein designated GAM RNA, and which when bound by GAM843 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM843 target proteins.

[11679] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM843 gene, herein designated GAM GENE, on one or more

GAM843 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11680] It is yet further appreciated that specific functions, and accordingly utilities, of GAM843 correlate with, and may be deduced from, the identity of the target genes which GAM843 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11681] Nucleotide sequences of the GAM843 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM843 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM843 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM843 are further described hereinbelow with reference to Table 1.

[11682] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM843 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11683] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 844 (GAM844) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11684] GAM844 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM844 was detected is described hereinabove with reference to Figs. 2-8.

[11685] GAM844 gene, herein designated GAM GENE, and GAM844 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11686] GAM844 gene, herein designated GAM GENE, encodes a GAM844 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM844 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM844 precursor RNA is designated SEQ ID:821, and is provided hereinbelow with reference to the sequence listing part.

[11687] GAM844 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM844 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11688] An enzyme complex designated DICER COMPLEX, dices the GAM844 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM844 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM844 RNA is designated SEQ ID:3423, and is provided hereinbelow with reference to the sequence listing part.

[11689] GAM844 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM844 target RNA, herein designated GAM TARGET RNA. GAM844 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11690] GAM844 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM844 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM844 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM844 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM844 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11691] The complementary binding of GAM844 RNA, herein designated GAM RNA, to target binding sites on GAM844 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM844 target RNA, herein designated GAM TARGET RNA, into GAM844 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11692] It is appreciated that GAM844 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM844 target genes. The mRNA of each one of this plurality of GAM844 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM844 RNA, herein designated GAM RNA, and which when bound by GAM844 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM844 target proteins.

[11693] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM844 gene, herein designated GAM GENE, on one or more GAM844 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11694] It is yet further appreciated that specific functions, and accordingly utilities, of GAM844 correlate with, and may be deduced from, the identity of the target genes which GAM844 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11695] Nucleotide sequences of the GAM844 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM844 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM844 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM844 are further described hereinbelow with reference to Table 1.

[11696] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM844 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11697] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 845 (GAM845) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11698] GAM845 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM845 was detected is described hereinabove with reference to Figs. 2-8.

[11699] GAM845 gene, herein designated GAM GENE, and GAM845 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11700] GAM845 gene, herein designated GAM GENE, encodes a GAM845 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM845 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM845 precursor RNA is designated SEQ ID:822, and is provided hereinbelow with reference to the sequence listing part.

[11701] GAM845 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM845 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11702] An enzyme complex designated DICER COMPLEX, dices the GAM845 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM845 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM845 RNA is designated SEQ ID:3425, and is provided hereinbelow with reference to the sequence listing part.

[11703] GAM845 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM845 target RNA, herein designated GAM TARGET RNA. GAM845 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11704] GAM845 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM845

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM845 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM845 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM845 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11705] The complementary binding of GAM845 RNA, herein designated GAM RNA, to target binding sites on GAM845 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM845 target RNA, herein designated GAM TARGET RNA, into GAM845 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11706] It is appreciated that GAM845 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM845 target genes. The mRNA of each one of this plurality of GAM845 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM845 RNA, herein designated GAM RNA, and which when bound by GAM845 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM845 target proteins.

[11707] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM845 gene, herein designated GAM GENE, on one or more GAM845 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11708] It is yet further appreciated that specific functions, and accordingly utilities, of GAM845 correlate with, and may be deduced from, the identity of the target genes which GAM845 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11709] Nucleotide sequences of the GAM845 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM845 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM845 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM845 are further described hereinbelow with

reference to Table 1.

[11710] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM845 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11711] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 846 (GAM846) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11712] GAM846 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM846 was detected is described hereinabove with reference to Figs. 2-8.

[11713] GAM846 gene, herein designated GAM GENE, and GAM846 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11714] GAM846 gene, herein designated GAM GENE, encodes a GAM846 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM846 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM846 precursor RNA is designated SEQ ID:823, and is provided

hereinbelow with reference to the sequence listing part.

[11715] GAM846 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11716] An enzyme complex designated DICER COMPLEX, dices the GAM846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM846 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM846 RNA is designated SEQ ID:3424, and is provided hereinbelow with reference to the sequence listing part.

[11717] GAM846 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM846 target RNA, herein designated GAM TARGET RNA. GAM846 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[11718] GAM846 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM846 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM846 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM846 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM846 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11719] The complementary binding of GAM846 RNA, herein designated GAM RNA, to target binding sites on GAM846 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM846 target RNA, herein designated GAM TARGET RNA, into GAM846 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11720] It is appreciated that GAM846 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM846 target genes. The mRNA of each one of this plurality of GAM846 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM846 RNA, herein designated GAM RNA, and which when bound by GAM846 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM846 target proteins.

[11721] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM846 gene, herein designated GAM GENE, on one or more GAM846 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11722] It is yet further appreciated that specific functions, and accordingly utilities, of GAM846 correlate with, and may be deduced from, the identity of the target genes which GAM846 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11723] Nucleotide sequences of the GAM846 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM846 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM846 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM846 are further described hereinbelow with reference to Table 1.

[11724] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM846 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11725] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 847 (GAM847) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11726] GAM847 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM847 was detected is described hereinabove with reference to Figs. 2-8.

[11727] GAM847 gene, herein designated GAM GENE, and GAM847 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11728] GAM847 gene, herein designated GAM GENE, encodes a GAM847 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM847 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM847 precursor RNA is designated SEQ ID:824, and is provided hereinbelow with reference to the sequence listing part.

[11729] GAM847 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM847 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11730] An enzyme complex designated DICER COMPLEX, dices the GAM847 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM847 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM847 RNA is designated SEQ ID:3426, and is provided hereinbelow with reference to the sequence listing part.

[11731] GAM847 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM847 target RNA, herein designated

GAM TARGET RNA. GAM847 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11732] GAM847 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM847 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM847 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM847 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM847 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11733] The complementary binding of GAM847 RNA, herein designated GAM RNA, to target binding sites on GAM847 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM847 target RNA, herein designated GAM

TARGET RNA, into GAM847 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11734] It is appreciated that GAM847 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM847 target genes. The mRNA of each one of this plurality of GAM847 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM847 RNA, herein designated GAM RNA, and which when bound by GAM847 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM847 target proteins.

[11735] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM847 gene, herein designated GAM GENE, on one or more GAM847 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11736] It is yet further appreciated that specific functions, and accordingly utilities, of GAM847 correlate with, and may be deduced from, the identity of the target

genes which GAM847 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11737] Nucleotide sequences of the GAM847 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM847 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM847 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM847 are further described hereinbelow with reference to Table 1.

[11738] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM847 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11739] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 848 (GAM848) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11740] GAM848 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM848 was detected is described hereinabove with reference to Figs. 2-8.

[11741] GAM848 gene, herein designated GAM GENE, and GAM848 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[11742] GAM848 gene, herein designated GAM GENE, encodes a GAM848 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM848 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM848 precursor RNA is designated SEQ ID:825, and is provided hereinbelow with reference to the sequence listing part.

[11743] GAM848 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM848 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11744] An enzyme complex designated DICER COMPLEX, dices the GAM848 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM848 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM848 RNA is designated SEQ ID:3427, and is provided

hereinbelow with reference to the sequence listing part.

[11745] GAM848 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM848 target RNA, herein designated GAM TARGET RNA. GAM848 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11746] GAM848 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM848 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM848 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM848 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM848 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11747] The complementary binding of GAM848 RNA, herein designated GAM RNA, to target binding sites on GAM848 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM848 target RNA, herein designated GAM TARGET RNA, into GAM848 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11748] It is appreciated that GAM848 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM848 target genes. The mRNA of each one of this plurality of GAM848 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM848 RNA, herein designated GAM RNA, and which when bound by GAM848 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM848 target proteins.

[11749] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM848 gene, herein designated GAM GENE, on one or more GAM848 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11750] It is yet further appreciated that specific functions, and accordingly utilities, of GAM848 correlate with, and may be deduced from, the identity of the target genes which GAM848 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11751] Nucleotide sequences of the GAM848 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM848 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM848 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM848 are further described hereinbelow with reference to Table 1.

[11752] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM848 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11753] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 849 (GAM849) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11754] GAM849 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM849 was detected is

described hereinabove with reference to Figs. 2-8.

[11755] GAM849 gene, herein designated GAM GENE, and GAM849 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11756] GAM849 gene, herein designated GAM GENE, encodes a GAM849 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM849 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM849 precursor RNA is designated SEQ ID:826, and is provided hereinbelow with reference to the sequence listing part.

[11757] GAM849 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM849 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11758] An enzyme complex designated DICER COMPLEX, dices the GAM849 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM849 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM849 RNA is designated SEQ ID:3428, and is provided hereinbelow with reference to the sequence listing part.

[11759] GAM849 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM849 target RNA, herein designated GAM TARGET RNA. GAM849 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11760] GAM849 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM849 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM849 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM849 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM849 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11761] The complementary binding of GAM849 RNA, herein designated GAM RNA, to target binding sites on GAM849 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM849 target RNA, herein designated GAM TARGET RNA, into GAM849 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11762] It is appreciated that GAM849 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM849 target genes. The mRNA of each one of this plurality of GAM849 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM849 RNA, herein designated GAM RNA, and which when bound by GAM849 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM849 target proteins.

[11763] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM849 gene, herein designated GAM GENE, on one or more GAM849 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11764] It is yet further appreciated that specific functions, and accordingly utilities, of GAM849 correlate with, and may be deduced from, the identity of the target genes which GAM849 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11765] Nucleotide sequences of the GAM849 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM849 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM849 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM849 are further described hereinbelow with reference to Table 1.

[11766] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM849 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11767] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 850 (GAM850) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11768] GAM850 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM850 was detected is described hereinabove with reference to Figs. 2-8.

[11769] GAM850 gene, herein designated GAM GENE, and GAM850 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11770] GAM850 gene, herein designated GAM GENE, encodes a GAM850 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM850 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM850 precursor RNA is designated SEQ ID:827, and is provided hereinbelow with reference to the sequence listing part.

[11771] GAM850 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM850 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11772] An enzyme complex designated DICER COMPLEX, dices the GAM850 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM850 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM850 RNA is designated SEQ ID:3429, and is provided hereinbelow with reference to the sequence listing part.

[11773] GAM850 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM850 target RNA, herein designated GAM TARGET RNA. GAM850 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11774] GAM850 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM850 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM850 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM850 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM850 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11775] The complementary binding of GAM850 RNA, herein designated GAM RNA, to target binding sites on GAM850 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM850 target RNA, herein designated GAM TARGET RNA, into GAM850 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11776] It is appreciated that GAM850 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM850 target genes. The mRNA of each one of this plurality of GAM850 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM850 RNA, herein designated GAM RNA, and which when bound by GAM850 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM850 target proteins.

[11777] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM850 gene, herein designated GAM GENE, on one or more GAM850 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11778] It is yet further appreciated that specific functions, and accordingly utilities, of GAM850 correlate with, and may be deduced from, the identity of the target genes which GAM850 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11779] Nucleotide sequences of the GAM850 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM850 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM850 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM850 are further described hereinbelow with reference to Table 1.

[11780] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM850 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11781] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 851 (GAM851) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11782] GAM851 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM851 was detected is described hereinabove with reference to Figs. 2-8.

[11783] GAM851 gene, herein designated GAM GENE, and GAM851 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11784] GAM851 gene, herein designated GAM GENE, encodes a GAM851 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM851 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM851 precursor RNA is designated SEQ ID:828, and is provided hereinbelow with reference to the sequence listing part.

[11785] GAM851 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM851 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11786] An enzyme complex designated DICER COMPLEX, dices the GAM851 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM851 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM851 RNA is designated SEQ ID:3430, and is provided hereinbelow with reference to the sequence listing part.

[11787] GAM851 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM851 target RNA, herein designated GAM TARGET RNA. GAM851 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11788] GAM851 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM851 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM851 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM851 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM851 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11789] The complementary binding of GAM851 RNA, herein designated GAM RNA, to target binding sites on GAM851 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM851 target RNA, herein designated GAM TARGET RNA, into GAM851 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11790] It is appreciated that GAM851 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM851 target genes. The mRNA of each one of this plurality of GAM851 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM851 RNA, herein designated GAM RNA, and which when bound by GAM851 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM851 target proteins.

[11791] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM851 gene, herein designated GAM GENE, on one or more

GAM851 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11792] It is yet further appreciated that specific functions, and accordingly utilities, of GAM851 correlate with, and may be deduced from, the identity of the target genes which GAM851 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11793] Nucleotide sequences of the GAM851 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM851 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM851 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM851 are further described hereinbelow with reference to Table 1.

[11794] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM851 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11795] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 852 (GAM852) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11796] GAM852 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM852 was detected is described hereinabove with reference to Figs. 2-8.

[11797] GAM852 gene, herein designated GAM GENE, and GAM852 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11798] GAM852 gene, herein designated GAM GENE, encodes a GAM852 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM852 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM852 precursor RNA is designated SEQ ID:829, and is provided hereinbelow with reference to the sequence listing part.

[11799] GAM852 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM852 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11800] An enzyme complex designated DICER COMPLEX, dices the GAM852 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM852 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM852 RNA is designated SEQ ID:3431, and is provided hereinbelow with reference to the sequence listing part.

[11801] GAM852 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM852 target RNA, herein designated GAM TARGET RNA. GAM852 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11802] GAM852 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM852 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM852 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM852 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM852 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11803] The complementary binding of GAM852 RNA, herein designated GAM RNA, to target binding sites on GAM852 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM852 target RNA, herein designated GAM TARGET RNA, into GAM852 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11804] It is appreciated that GAM852 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM852 target genes. The mRNA of each one of this plurality of GAM852 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM852 RNA, herein designated GAM RNA, and which when bound by GAM852 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM852 target proteins.

[11805] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM852 gene, herein designated GAM GENE, on one or more GAM852 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11806] It is yet further appreciated that specific functions, and accordingly utilities, of GAM852 correlate with, and may be deduced from, the identity of the target genes which GAM852 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11807] Nucleotide sequences of the GAM852 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM852 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM852 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM852 are further described hereinbelow with reference to Table 1.

[11808] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM852 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11809] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 853 (GAM853) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11810] GAM853 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM853 was detected is described hereinabove with reference to Figs. 2-8.

[11811] GAM853 gene, herein designated GAM GENE, and GAM853 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11812] GAM853 gene, herein designated GAM GENE, encodes a GAM853 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM853 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM853 precursor RNA is designated SEQ ID:830, and is provided hereinbelow with reference to the sequence listing part.

[11813] GAM853 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM853 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11814] An enzyme complex designated DICER COMPLEX, dices the GAM853 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM853 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM853 RNA is designated SEQ ID:3432, and is provided hereinbelow with reference to the sequence listing part.

[11815] GAM853 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM853 target RNA, herein designated GAM TARGET RNA. GAM853 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11816] GAM853 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM853

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM853 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM853 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM853 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11817] The complementary binding of GAM853 RNA, herein designated GAM RNA, to target binding sites on GAM853 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM853 target RNA, herein designated GAM TARGET RNA, into GAM853 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11818] It is appreciated that GAM853 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM853 target genes. The mRNA of each one of this plurality of GAM853 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM853 RNA, herein designated GAM RNA, and which when bound by GAM853 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM853 target proteins.

[11819] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM853 gene, herein designated GAM GENE, on one or more GAM853 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11820] It is yet further appreciated that specific functions, and accordingly utilities, of GAM853 correlate with, and may be deduced from, the identity of the target genes which GAM853 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11821] Nucleotide sequences of the GAM853 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM853 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM853 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM853 are further described hereinbelow with

reference to Table 1.

[11822] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM853 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11823] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 854 (GAM854) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11824] GAM854 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM854 was detected is described hereinabove with reference to Figs. 2-8.

[11825] GAM854 gene, herein designated GAM GENE, and GAM854 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11826] GAM854 gene, herein designated GAM GENE, encodes a GAM854 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM854 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM854 precursor RNA is designated SEQ ID:831, and is provided

hereinbelow with reference to the sequence listing part.

[11827] GAM854 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM854 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11828] An enzyme complex designated DICER COMPLEX, dices the GAM854 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM854 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM854 RNA is designated SEQ ID:3433, and is provided hereinbelow with reference to the sequence listing part.

[11829] GAM854 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM854 target RNA, herein designated GAM TARGET RNA. GAM854 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[11830] GAM854 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM854 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM854 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM854 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM854 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11831] The complementary binding of GAM854 RNA, herein designated GAM RNA, to target binding sites on GAM854 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM854 target RNA, herein designated GAM TARGET RNA, into GAM854 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11832] It is appreciated that GAM854 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM854 target genes. The mRNA of each one of this plurality of GAM854 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM854 RNA, herein designated GAM RNA, and which when bound by GAM854 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM854 target proteins.

[11833] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM854 gene, herein designated GAM GENE, on one or more GAM854 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11834] It is yet further appreciated that specific functions, and accordingly utilities, of GAM854 correlate with, and may be deduced from, the identity of the target genes which GAM854 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11835] Nucleotide sequences of the GAM854 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM854 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM854 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM854 are further described hereinbelow with reference to Table 1.

[11836] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM854 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11837] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 855 (GAM855) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11838] GAM855 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM855 was detected is described hereinabove with reference to Figs. 2-8.

[11839] GAM855 gene, herein designated GAM GENE, and GAM855 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11840] GAM855 gene, herein designated GAM GENE, encodes a GAM855 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM855 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM855 precursor RNA is designated SEQ ID:832, and is provided hereinbelow with reference to the sequence listing part.

[11841] GAM855 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM855 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11842] An enzyme complex designated DICER COMPLEX, dices the GAM855 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM855 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM855 RNA is designated SEQ ID:3434, and is provided hereinbelow with reference to the sequence listing part.

[11843] GAM855 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM855 target RNA, herein designated

GAM TARGET RNA. GAM855 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11844] GAM855 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM855 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM855 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM855 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM855 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11845] The complementary binding of GAM855 RNA, herein designated GAM RNA, to target binding sites on GAM855 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM855 target RNA, herein designated GAM

TARGET RNA, into GAM855 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11846] It is appreciated that GAM855 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM855 target genes. The mRNA of each one of this plurality of GAM855 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM855 RNA, herein designated GAM RNA, and which when bound by GAM855 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM855 target proteins.

[11847] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM855 gene, herein designated GAM GENE, on one or more GAM855 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11848] It is yet further appreciated that specific functions, and accordingly utilities, of GAM855 correlate with, and may be deduced from, the identity of the target

genes which GAM855 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11849] Nucleotide sequences of the GAM855 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM855 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM855 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM855 are further described hereinbelow with reference to Table 1.

[11850] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM855 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11851] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 856 (GAM856) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11852] GAM856 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM856 was detected is described hereinabove with reference to Figs. 2-8.

[11853] GAM856 gene, herein designated GAM GENE, and GAM856 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[11854] GAM856 gene, herein designated GAM GENE, encodes a GAM856 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM856 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM856 precursor RNA is designated SEQ ID:833, and is provided hereinbelow with reference to the sequence listing part.

[11855] GAM856 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM856 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11856] An enzyme complex designated DICER COMPLEX, dices the GAM856 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM856 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM856 RNA is designated SEQ ID:3435, and is provided

hereinbelow with reference to the sequence listing part.

[11857] GAM856 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM856 target RNA, herein designated GAM TARGET RNA. GAM856 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11858] GAM856 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM856 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM856 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM856 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM856 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11859] The complementary binding of GAM856 RNA, herein designated GAM RNA, to target binding sites on GAM856 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM856 target RNA, herein designated GAM TARGET RNA, into GAM856 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11860] It is appreciated that GAM856 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM856 target genes. The mRNA of each one of this plurality of GAM856 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM856 RNA, herein designated GAM RNA, and which when bound by GAM856 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM856 target proteins.

[11861] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM856 gene, herein designated GAM GENE, on one or more GAM856 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11862] It is yet further appreciated that specific functions, and accordingly utilities, of GAM856 correlate with, and may be deduced from, the identity of the target genes which GAM856 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11863] Nucleotide sequences of the GAM856 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM856 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM856 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM856 are further described hereinbelow with reference to Table 1.

[11864] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM856 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11865] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 857 (GAM857) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11866] GAM857 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM857 was detected is

described hereinabove with reference to Figs. 2-8.

[11867] GAM857 gene, herein designated GAM GENE, and GAM857 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11868] GAM857 gene, herein designated GAM GENE, encodes a GAM857 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM857 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM857 precursor RNA is designated SEQ ID:834, and is provided hereinbelow with reference to the sequence listing part.

[11869] GAM857 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM857 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11870] An enzyme complex designated DICER COMPLEX, dices the GAM857 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM857 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM857 RNA is designated SEQ ID:3436, and is provided hereinbelow with reference to the sequence listing part.

[11871] GAM857 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM857 target RNA, herein designated GAM TARGET RNA. GAM857 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11872] GAM857 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM857 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM857 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM857 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM857 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11873] The complementary binding of GAM857 RNA, herein designated GAM RNA, to target binding sites on GAM857 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM857 target RNA, herein designated GAM TARGET RNA, into GAM857 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11874] It is appreciated that GAM857 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM857 target genes. The mRNA of each one of this plurality of GAM857 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM857 RNA, herein designated GAM RNA, and which when bound by GAM857 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM857 target proteins.

[11875] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM857 gene, herein designated GAM GENE, on one or more GAM857 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11876] It is yet further appreciated that specific functions, and accordingly utilities, of GAM857 correlate with, and may be deduced from, the identity of the target genes which GAM857 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11877] Nucleotide sequences of the GAM857 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM857 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM857 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM857 are further described hereinbelow with reference to Table 1.

[11878] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM857 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11879] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 858 (GAM858) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11880] GAM858 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM858 was detected is described hereinabove with reference to Figs. 2-8.

[11881] GAM858 gene, herein designated GAM GENE, and GAM858 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11882] GAM858 gene, herein designated GAM GENE, encodes a GAM858 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM858 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM858 precursor RNA is designated SEQ ID:835, and is provided hereinbelow with reference to the sequence listing part.

[11883] GAM858 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM858 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11884] An enzyme complex designated DICER COMPLEX, dices the GAM858 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM858 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM858 RNA is designated SEQ ID:3437, and is provided hereinbelow with reference to the sequence listing part.

[11885] GAM858 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM858 target RNA, herein designated GAM TARGET RNA. GAM858 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11886] GAM858 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM858 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM858 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM858 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM858 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11887] The complementary binding of GAM858 RNA, herein designated GAM RNA, to target binding sites on GAM858 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM858 target RNA, herein designated GAM TARGET RNA, into GAM858 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11888] It is appreciated that GAM858 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM858 target genes. The mRNA of each one of this plurality of GAM858 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM858 RNA, herein designated GAM RNA, and which when bound by GAM858 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM858 target proteins.

[11889] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM858 gene, herein designated GAM GENE, on one or more GAM858 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11890] It is yet further appreciated that specific functions, and accordingly utilities, of GAM858 correlate with, and may be deduced from, the identity of the target genes which GAM858 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11891] Nucleotide sequences of the GAM858 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM858 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM858 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM858 are further described hereinbelow with reference to Table 1.

[11892] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM858 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11893] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 859 (GAM859) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11894] GAM859 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM859 was detected is described hereinabove with reference to Figs. 2-8.

[11895] GAM859 gene, herein designated GAM GENE, and GAM859 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11896] GAM859 gene, herein designated GAM GENE, encodes a GAM859 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM859 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM859 precursor RNA is designated SEQ ID:836, and is provided hereinbelow with reference to the sequence listing part.

[11897] GAM859 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM859 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11898] An enzyme complex designated DICER COMPLEX, dices the GAM859 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM859 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM859 RNA is designated SEQ ID:3438, and is provided hereinbelow with reference to the sequence listing part.

[11899] GAM859 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM859 target RNA, herein designated GAM TARGET RNA. GAM859 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11900] GAM859 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM859 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM859 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM859 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM859 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11901] The complementary binding of GAM859 RNA, herein designated GAM RNA, to target binding sites on GAM859 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM859 target RNA, herein designated GAM TARGET RNA, into GAM859 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11902] It is appreciated that GAM859 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM859 target genes. The mRNA of each one of this plurality of GAM859 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM859 RNA, herein designated GAM RNA, and which when bound by GAM859 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM859 target proteins.

[11903] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM859 gene, herein designated GAM GENE, on one or more

GAM859 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11904] It is yet further appreciated that specific functions, and accordingly utilities, of GAM859 correlate with, and may be deduced from, the identity of the target genes which GAM859 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11905] Nucleotide sequences of the GAM859 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM859 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM859 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM859 are further described hereinbelow with reference to Table 1.

[11906] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM859 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11907] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 860 (GAM860) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11908] GAM860 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM860 was detected is described hereinabove with reference to Figs. 2-8.

[11909] GAM860 gene, herein designated GAM GENE, and GAM860 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11910] GAM860 gene, herein designated GAM GENE, encodes a GAM860 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM860 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM860 precursor RNA is designated SEQ ID:837, and is provided hereinbelow with reference to the sequence listing part.

[11911] GAM860 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM860 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11912] An enzyme complex designated DICER COMPLEX, dices the GAM860 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM860 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM860 RNA is designated SEQ ID:3439, and is provided hereinbelow with reference to the sequence listing part.

[11913] GAM860 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM860 target RNA, herein designated GAM TARGET RNA. GAM860 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11914] GAM860 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM860 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM860 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM860 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM860 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11915] The complementary binding of GAM860 RNA, herein designated GAM RNA, to target binding sites on GAM860 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM860 target RNA, herein designated GAM TARGET RNA, into GAM860 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11916] It is appreciated that GAM860 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM860 target genes. The mRNA of each one of this plurality of GAM860 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM860 RNA, herein designated GAM RNA, and which when bound by GAM860 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM860 target proteins.

[11917] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM860 gene, herein designated GAM GENE, on one or more GAM860 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11918] It is yet further appreciated that specific functions, and accordingly utilities, of GAM860 correlate with, and may be deduced from, the identity of the target genes which GAM860 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11919] Nucleotide sequences of the GAM860 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM860 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM860 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM860 are further described hereinbelow with reference to Table 1.

[11920] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM860 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11921] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 861 (GAM861) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11922] GAM861 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM861 was detected is described hereinabove with reference to Figs. 2-8.

[11923] GAM861 gene, herein designated GAM GENE, and GAM861 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11924] GAM861 gene, herein designated GAM GENE, encodes a GAM861 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM861 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM861 precursor RNA is designated SEQ ID:838, and is provided hereinbelow with reference to the sequence listing part.

[11925] GAM861 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM861 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11926] An enzyme complex designated DICER COMPLEX, dices the GAM861 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM861 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM861 RNA is designated SEQ ID:3441, and is provided hereinbelow with reference to the sequence listing part.

[11927] GAM861 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM861 target RNA, herein designated GAM TARGET RNA. GAM861 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11928] GAM861 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM861

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM861 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM861 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM861 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11929] The complementary binding of GAM861 RNA, herein designated GAM RNA, to target binding sites on GAM861 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM861 target RNA, herein designated GAM TARGET RNA, into GAM861 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11930] It is appreciated that GAM861 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM861 target genes. The mRNA of each one of this plurality of GAM861 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM861 RNA, herein designated GAM RNA, and which when bound by GAM861 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM861 target proteins.

[11931] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM861 gene, herein designated GAM GENE, on one or more GAM861 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11932] It is yet further appreciated that specific functions, and accordingly utilities, of GAM861 correlate with, and may be deduced from, the identity of the target genes which GAM861 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11933] Nucleotide sequences of the GAM861 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM861 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM861 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM861 are further described hereinbelow with

reference to Table 1.

[11934] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM861 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11935] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 862 (GAM862) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11936] GAM862 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM862 was detected is described hereinabove with reference to Figs. 2-8.

[11937] GAM862 gene, herein designated GAM GENE, and GAM862 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11938] GAM862 gene, herein designated GAM GENE, encodes a GAM862 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM862 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM862 precursor RNA is designated SEQ ID:839, and is provided

hereinbelow with reference to the sequence listing part.

[11939] GAM862 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM862 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11940] An enzyme complex designated DICER COMPLEX, dices the GAM862 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM862 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM862 RNA is designated SEQ ID:3440, and is provided hereinbelow with reference to the sequence listing part.

[11941] GAM862 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM862 target RNA, herein designated GAM TARGET RNA. GAM862 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[11942] GAM862 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM862 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM862 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM862 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM862 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11943] The complementary binding of GAM862 RNA, herein designated GAM RNA, to target binding sites on GAM862 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM862 target RNA, herein designated GAM TARGET RNA, into GAM862 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11944] It is appreciated that GAM862 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM862 target genes. The mRNA of each one of this plurality of GAM862 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM862 RNA, herein designated GAM RNA, and which when bound by GAM862 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM862 target proteins.

[11945] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM862 gene, herein designated GAM GENE, on one or more GAM862 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11946] It is yet further appreciated that specific functions, and accordingly utilities, of GAM862 correlate with, and may be deduced from, the identity of the target genes which GAM862 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11947] Nucleotide sequences of the GAM862 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM862 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM862 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM862 are further described hereinbelow with reference to Table 1.

[11948] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM862 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11949] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 863 (GAM863) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11950] GAM863 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM863 was detected is described hereinabove with reference to Figs. 2-8.

[11951] GAM863 gene, herein designated GAM GENE, and GAM863 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11952] GAM863 gene, herein designated GAM GENE, encodes a GAM863 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM863 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM863 precursor RNA is designated SEQ ID:840, and is provided hereinbelow with reference to the sequence listing part.

[11953] GAM863 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM863 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11954] An enzyme complex designated DICER COMPLEX, dices the GAM863 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM863 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM863 RNA is designated SEQ ID:3442, and is provided hereinbelow with reference to the sequence listing part.

[11955] GAM863 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM863 target RNA, herein designated

GAM TARGET RNA. GAM863 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11956] GAM863 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM863 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM863 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM863 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM863 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11957] The complementary binding of GAM863 RNA, herein designated GAM RNA, to target binding sites on GAM863 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM863 target RNA, herein designated GAM

TARGET RNA, into GAM863 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11958] It is appreciated that GAM863 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM863 target genes. The mRNA of each one of this plurality of GAM863 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM863 RNA, herein designated GAM RNA, and which when bound by GAM863 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM863 target proteins.

[11959] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM863 gene, herein designated GAM GENE, on one or more GAM863 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11960] It is yet further appreciated that specific functions, and accordingly utilities, of GAM863 correlate with, and may be deduced from, the identity of the target

genes which GAM863 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11961] Nucleotide sequences of the GAM863 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM863 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM863 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM863 are further described hereinbelow with reference to Table 1.

[11962] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM863 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11963] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 864 (GAM864) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11964] GAM864 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM864 was detected is described hereinabove with reference to Figs. 2-8.

[11965] GAM864 gene, herein designated GAM GENE, and GAM864 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[11966] GAM864 gene, herein designated GAM GENE, encodes a GAM864 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM864 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM864 precursor RNA is designated SEQ ID:841, and is provided hereinbelow with reference to the sequence listing part.

[11967] GAM864 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM864 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11968] An enzyme complex designated DICER COMPLEX, dices the GAM864 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM864 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM864 RNA is designated SEQ ID:3443, and is provided

hereinbelow with reference to the sequence listing part.

[11969] GAM864 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM864 target RNA, herein designated GAM TARGET RNA. GAM864 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11970] GAM864 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM864 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM864 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM864 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM864 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11971] The complementary binding of GAM864 RNA, herein designated GAM RNA, to target binding sites on GAM864 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM864 target RNA, herein designated GAM TARGET RNA, into GAM864 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11972] It is appreciated that GAM864 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM864 target genes. The mRNA of each one of this plurality of GAM864 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM864 RNA, herein designated GAM RNA, and which when bound by GAM864 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM864 target proteins.

[11973] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM864 gene, herein designated GAM GENE, on one or more GAM864 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11974] It is yet further appreciated that specific functions, and accordingly utilities, of GAM864 correlate with, and may be deduced from, the identity of the target genes which GAM864 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11975] Nucleotide sequences of the GAM864 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM864 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM864 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM864 are further described hereinbelow with reference to Table 1.

[11976] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM864 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11977] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 865 (GAM865) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11978] GAM865 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM865 was detected is

described hereinabove with reference to Figs. 2-8.

[11979] GAM865 gene, herein designated GAM GENE, and GAM865 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11980] GAM865 gene, herein designated GAM GENE, encodes a GAM865 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM865 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM865 precursor RNA is designated SEQ ID:842, and is provided hereinbelow with reference to the sequence listing part.

[11981] GAM865 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM865 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11982] An enzyme complex designated DICER COMPLEX, dices the GAM865 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM865 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM865 RNA is designated SEQ ID:3444, and is provided hereinbelow with reference to the sequence listing part.

[11983] GAM865 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM865 target RNA, herein designated GAM TARGET RNA. GAM865 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11984] GAM865 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM865 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM865 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM865 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM865 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11985] The complementary binding of GAM865 RNA, herein designated GAM RNA, to target binding sites on GAM865 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM865 target RNA, herein designated GAM TARGET RNA, into GAM865 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[11986] It is appreciated that GAM865 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM865 target genes. The mRNA of each one of this plurality of GAM865 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM865 RNA, herein designated GAM RNA, and which when bound by GAM865 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM865 target proteins.

[11987] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM865 gene, herein designated GAM GENE, on one or more GAM865 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11988] It is yet further appreciated that specific functions, and accordingly utilities, of GAM865 correlate with, and may be deduced from, the identity of the target genes which GAM865 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[11989] Nucleotide sequences of the GAM865 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM865 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM865 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM865 are further described hereinbelow with reference to Table 1.

[11990] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM865 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[11991] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 866 (GAM866) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[11992] GAM866 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM866 was detected is described hereinabove with reference to Figs. 2-8.

[11993] GAM866 gene, herein designated GAM GENE, and GAM866 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[11994] GAM866 gene, herein designated GAM GENE, encodes a GAM866 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM866 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM866 precursor RNA is designated SEQ ID:843, and is provided hereinbelow with reference to the sequence listing part.

[11995] GAM866 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM866 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11996] An enzyme complex designated DICER COMPLEX, dices the GAM866 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM866 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM866 RNA is designated SEQ ID:3445, and is provided hereinbelow with reference to the sequence listing part.

[11997] GAM866 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM866 target RNA, herein designated GAM TARGET RNA. GAM866 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11998] GAM866 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM866 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM866 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM866 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM866 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11999] The complementary binding of GAM866 RNA, herein designated GAM RNA, to target binding sites on GAM866 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM866 target RNA, herein designated GAM TARGET RNA, into GAM866 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12000] It is appreciated that GAM866 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM866 target genes. The mRNA of each one of this plurality of GAM866 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM866 RNA, herein designated GAM RNA, and which when bound by GAM866 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM866 target proteins.

[12001] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM866 gene, herein designated GAM GENE, on one or more GAM866 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12002] It is yet further appreciated that specific functions, and accordingly utilities, of GAM866 correlate with, and may be deduced from, the identity of the target genes which GAM866 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12003] Nucleotide sequences of the GAM866 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM866 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM866 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM866 are further described hereinbelow with reference to Table 1.

[12004] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM866 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12005] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 867 (GAM867) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12006] GAM867 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM867 was detected is described hereinabove with reference to Figs. 2-8.

[12007] GAM867 gene, herein designated GAM GENE, and GAM867 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12008] GAM867 gene, herein designated GAM GENE, encodes a GAM867 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM867 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM867 precursor RNA is designated SEQ ID:844, and is provided hereinbelow with reference to the sequence listing part.

[12009] GAM867 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM867 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12010] An enzyme complex designated DICER COMPLEX, dices the GAM867 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM867 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM867 RNA is designated SEQ ID:3446, and is provided hereinbelow with reference to the sequence listing part.

[12011] GAM867 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM867 target RNA, herein designated GAM TARGET RNA. GAM867 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12012] GAM867 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM867 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM867 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM867 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM867 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12013] The complementary binding of GAM867 RNA, herein designated GAM RNA, to target binding sites on GAM867 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM867 target RNA, herein designated GAM TARGET RNA, into GAM867 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12014] It is appreciated that GAM867 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM867 target genes. The mRNA of each one of this plurality of GAM867 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM867 RNA, herein designated GAM RNA, and which when bound by GAM867 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM867 target proteins.

[12015] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM867 gene, herein designated GAM GENE, on one or more

GAM867 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12016] It is yet further appreciated that specific functions, and accordingly utilities, of GAM867 correlate with, and may be deduced from, the identity of the target genes which GAM867 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12017] Nucleotide sequences of the GAM867 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM867 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM867 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM867 are further described hereinbelow with reference to Table 1.

[12018] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM867 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12019] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 868 (GAM868) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12020] GAM868 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM868 was detected is described hereinabove with reference to Figs. 2-8.

[12021] GAM868 gene, herein designated GAM GENE, and GAM868 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12022] GAM868 gene, herein designated GAM GENE, encodes a GAM868 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM868 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM868 precursor RNA is designated SEQ ID:845, and is provided hereinbelow with reference to the sequence listing part.

[12023] GAM868 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12024] An enzyme complex designated DICER COMPLEX, dices the GAM868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM868 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM868 RNA is designated SEQ ID:3447, and is provided hereinbelow with reference to the sequence listing part.

[12025] GAM868 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM868 target RNA, herein designated GAM TARGET RNA. GAM868 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12026] GAM868 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM868 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM868 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM868 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM868 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12027] The complementary binding of GAM868 RNA, herein designated GAM RNA, to target binding sites on GAM868 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM868 target RNA, herein designated GAM TARGET RNA, into GAM868 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12028] It is appreciated that GAM868 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM868 target genes. The mRNA of each one of this plurality of GAM868 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM868 RNA, herein designated GAM RNA, and which when bound by GAM868 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM868 target proteins.

[12029] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM868 gene, herein designated GAM GENE, on one or more GAM868 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12030] It is yet further appreciated that specific functions, and accordingly utilities, of GAM868 correlate with, and may be deduced from, the identity of the target genes which GAM868 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12031] Nucleotide sequences of the GAM868 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM868 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM868 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM868 are further described hereinbelow with reference to Table 1.

[12032] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM868 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12033] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 869 (GAM869) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12034] GAM869 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM869 was detected is described hereinabove with reference to Figs. 2-8.

[12035] GAM869 gene, herein designated GAM GENE, and GAM869 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12036] GAM869 gene, herein designated GAM GENE, encodes a GAM869 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM869 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM869 precursor RNA is designated SEQ ID:846, and is provided hereinbelow with reference to the sequence listing part.

[12037] GAM869 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM869 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12038] An enzyme complex designated DICER COMPLEX, dices the GAM869 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM869 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM869 RNA is designated SEQ ID:3448, and is provided hereinbelow with reference to the sequence listing part.

[12039] GAM869 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM869 target RNA, herein designated GAM TARGET RNA. GAM869 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12040] GAM869 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM869

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM869 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM869 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM869 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12041] The complementary binding of GAM869 RNA, herein designated GAM RNA, to target binding sites on GAM869 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM869 target RNA, herein designated GAM TARGET RNA, into GAM869 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12042] It is appreciated that GAM869 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM869 target genes. The mRNA of each one of this plurality of GAM869 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM869 RNA, herein designated GAM RNA, and which when bound by GAM869 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM869 target proteins.

[12043] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM869 gene, herein designated GAM GENE, on one or more GAM869 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12044] It is yet further appreciated that specific functions, and accordingly utilities, of GAM869 correlate with, and may be deduced from, the identity of the target genes which GAM869 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12045] Nucleotide sequences of the GAM869 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM869 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM869 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM869 are further described hereinbelow with

reference to Table 1.

[12046] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM869 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12047] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 870 (GAM870) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12048] GAM870 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM870 was detected is described hereinabove with reference to Figs. 2-8.

[12049] GAM870 gene, herein designated GAM GENE, and GAM870 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12050] GAM870 gene, herein designated GAM GENE, encodes a GAM870 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM870 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM870 precursor RNA is designated SEQ ID:847, and is provided

hereinbelow with reference to the sequence listing part.

[12051] GAM870 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM870 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12052] An enzyme complex designated DICER COMPLEX, dices the GAM870 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM870 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM870 RNA is designated SEQ ID:3449, and is provided hereinbelow with reference to the sequence listing part.

[12053] GAM870 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM870 target RNA, herein designated GAM TARGET RNA. GAM870 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[12054] GAM870 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM870 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM870 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM870 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM870 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12055] The complementary binding of GAM870 RNA, herein designated GAM RNA, to target binding sites on GAM870 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM870 target RNA, herein designated GAM TARGET RNA, into GAM870 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12056] It is appreciated that GAM870 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM870 target genes. The mRNA of each one of this plurality of GAM870 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM870 RNA, herein designated GAM RNA, and which when bound by GAM870 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM870 target proteins.

[12057] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM870 gene, herein designated GAM GENE, on one or more GAM870 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12058] It is yet further appreciated that specific functions, and accordingly utilities, of GAM870 correlate with, and may be deduced from, the identity of the target genes which GAM870 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12059] Nucleotide sequences of the GAM870 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM870 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM870 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM870 are further described hereinbelow with reference to Table 1.

[12060] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM870 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12061] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 871 (GAM871) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12062] GAM871 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM871 was detected is described hereinabove with reference to Figs. 2-8.

[12063] GAM871 gene, herein designated GAM GENE, and GAM871 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12064] GAM871 gene, herein designated GAM GENE, encodes a GAM871 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM871 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM871 precursor RNA is designated SEQ ID:848, and is provided hereinbelow with reference to the sequence listing part.

[12065] GAM871 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM871 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12066] An enzyme complex designated DICER COMPLEX, dices the GAM871 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM871 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM871 RNA is designated SEQ ID:3450, and is provided hereinbelow with reference to the sequence listing part.

[12067] GAM871 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM871 target RNA, herein designated

GAM TARGET RNA. GAM871 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12068] GAM871 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM871 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM871 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM871 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM871 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12069] The complementary binding of GAM871 RNA, herein designated GAM RNA, to target binding sites on GAM871 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM871 target RNA, herein designated GAM

TARGET RNA, into GAM871 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12070] It is appreciated that GAM871 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM871 target genes. The mRNA of each one of this plurality of GAM871 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM871 RNA, herein designated GAM RNA, and which when bound by GAM871 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM871 target proteins.

[12071] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM871 gene, herein designated GAM GENE, on one or more GAM871 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12072] It is yet further appreciated that specific functions, and accordingly utilities, of GAM871 correlate with, and may be deduced from, the identity of the target

genes which GAM871 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12073] Nucleotide sequences of the GAM871 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM871 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM871 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM871 are further described hereinbelow with reference to Table 1.

[12074] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM871 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12075] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 872 (GAM872) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12076] GAM872 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM872 was detected is described hereinabove with reference to Figs. 2-8.

[12077] GAM872 gene, herein designated GAM GENE, and GAM872 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[12078] GAM872 gene, herein designated GAM GENE, encodes a GAM872 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM872 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM872 precursor RNA is designated SEQ ID:849, and is provided hereinbelow with reference to the sequence listing part.

[12079] GAM872 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM872 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12080] An enzyme complex designated DICER COMPLEX, dices the GAM872 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM872 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM872 RNA is designated SEQ ID:3452, and is provided

hereinbelow with reference to the sequence listing part.

[12081] GAM872 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM872 target RNA, herein designated GAM TARGET RNA. GAM872 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12082] GAM872 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM872 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM872 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM872 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM872 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12083] The complementary binding of GAM872 RNA, herein designated GAM RNA, to target binding sites on GAM872 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM872 target RNA, herein designated GAM TARGET RNA, into GAM872 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12084] It is appreciated that GAM872 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM872 target genes. The mRNA of each one of this plurality of GAM872 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM872 RNA, herein designated GAM RNA, and which when bound by GAM872 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM872 target proteins.

[12085] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM872 gene, herein designated GAM GENE, on one or more GAM872 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12086] It is yet further appreciated that specific functions, and accordingly utilities, of GAM872 correlate with, and may be deduced from, the identity of the target genes which GAM872 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12087] Nucleotide sequences of the GAM872 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM872 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM872 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM872 are further described hereinbelow with reference to Table 1.

[12088] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM872 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12089] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 873 (GAM873) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12090] GAM873 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM873 was detected is

described hereinabove with reference to Figs. 2-8.

[12091] GAM873 gene, herein designated GAM GENE, and GAM873 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12092] GAM873 gene, herein designated GAM GENE, encodes a GAM873 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM873 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM873 precursor RNA is designated SEQ ID:850, and is provided hereinbelow with reference to the sequence listing part.

[12093] GAM873 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM873 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12094] An enzyme complex designated DICER COMPLEX, dices the GAM873 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM873 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM873 RNA is designated SEQ ID:3451, and is provided hereinbelow with reference to the sequence listing part.

[12095] GAM873 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM873 target RNA, herein designated GAM TARGET RNA. GAM873 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12096] GAM873 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM873 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM873 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM873 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM873 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12097] The complementary binding of GAM873 RNA, herein designated GAM RNA, to target binding sites on GAM873 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM873 target RNA, herein designated GAM TARGET RNA, into GAM873 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12098] It is appreciated that GAM873 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM873 target genes. The mRNA of each one of this plurality of GAM873 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM873 RNA, herein designated GAM RNA, and which when bound by GAM873 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM873 target proteins.

[12099] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM873 gene, herein designated GAM GENE, on one or more GAM873 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12100] It is yet further appreciated that specific functions, and accordingly utilities, of GAM873 correlate with, and may be deduced from, the identity of the target genes which GAM873 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12101] Nucleotide sequences of the GAM873 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM873 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM873 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM873 are further described hereinbelow with reference to Table 1.

[12102] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM873 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12103] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 874 (GAM874) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12104] GAM874 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM874 was detected is described hereinabove with reference to Figs. 2-8.

[12105] GAM874 gene, herein designated GAM GENE, and GAM874 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12106] GAM874 gene, herein designated GAM GENE, encodes a GAM874 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM874 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM874 precursor RNA is designated SEQ ID:851, and is provided hereinbelow with reference to the sequence listing part.

[12107] GAM874 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM874 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12108] An enzyme complex designated DICER COMPLEX, dices the GAM874 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM874 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM874 RNA is designated SEQ ID:3453, and is provided hereinbelow with reference to the sequence listing part.

[12109] GAM874 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM874 target RNA, herein designated GAM TARGET RNA. GAM874 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12110] GAM874 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM874 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM874 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM874 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM874 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12111] The complementary binding of GAM874 RNA, herein designated GAM RNA, to target binding sites on GAM874 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM874 target RNA, herein designated GAM TARGET RNA, into GAM874 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12112] It is appreciated that GAM874 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM874 target genes. The mRNA of each one of this plurality of GAM874 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM874 RNA, herein designated GAM RNA, and which when bound by GAM874 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM874 target proteins.

[12113] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM874 gene, herein designated GAM GENE, on one or more GAM874 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12114] It is yet further appreciated that specific functions, and accordingly utilities, of GAM874 correlate with, and may be deduced from, the identity of the target genes which GAM874 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12115] Nucleotide sequences of the GAM874 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM874 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM874 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM874 are further described hereinbelow with reference to Table 1.

[12116] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM874 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12117] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 875 (GAM875) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12118] GAM875 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM875 was detected is described hereinabove with reference to Figs. 2-8.

[12119] GAM875 gene, herein designated GAM GENE, and GAM875 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12120] GAM875 gene, herein designated GAM GENE, encodes a GAM875 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM875 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM875 precursor RNA is designated SEQ ID:852, and is provided hereinbelow with reference to the sequence listing part.

[12121] GAM875 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM875 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12122] An enzyme complex designated DICER COMPLEX, dices the GAM875 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM875 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM875 RNA is designated SEQ ID:3454, and is provided hereinbelow with reference to the sequence listing part.

[12123] GAM875 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM875 target RNA, herein designated GAM TARGET RNA. GAM875 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12124] GAM875 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM875 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM875 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM875 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM875 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12125] The complementary binding of GAM875 RNA, herein designated GAM RNA, to target binding sites on GAM875 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM875 target RNA, herein designated GAM TARGET RNA, into GAM875 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12126] It is appreciated that GAM875 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM875 target genes. The mRNA of each one of this plurality of GAM875 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM875 RNA, herein designated GAM RNA, and which when bound by GAM875 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM875 target proteins.

[12127] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM875 gene, herein designated GAM GENE, on one or more

GAM875 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12128] It is yet further appreciated that specific functions, and accordingly utilities, of GAM875 correlate with, and may be deduced from, the identity of the target genes which GAM875 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12129] Nucleotide sequences of the GAM875 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM875 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM875 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM875 are further described hereinbelow with reference to Table 1.

[12130] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM875 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12131] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 876 (GAM876) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12132] GAM876 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM876 was detected is described hereinabove with reference to Figs. 2-8.

[12133] GAM876 gene, herein designated GAM GENE, and GAM876 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12134] GAM876 gene, herein designated GAM GENE, encodes a GAM876 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM876 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM876 precursor RNA is designated SEQ ID:853, and is provided hereinbelow with reference to the sequence listing part.

[12135] GAM876 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM876 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12136] An enzyme complex designated DICER COMPLEX, dices the GAM876 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM876 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of GAM876 RNA is designated SEQ ID:3456, and is provided hereinbelow with reference to the sequence listing part.

[12137] GAM876 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM876 target RNA, herein designated GAM TARGET RNA. GAM876 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12138] GAM876 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM876 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM876 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM876 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM876 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12139] The complementary binding of GAM876 RNA, herein designated GAM RNA, to target binding sites on GAM876 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM876 target RNA, herein designated GAM TARGET RNA, into GAM876 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12140] It is appreciated that GAM876 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM876 target genes. The mRNA of each one of this plurality of GAM876 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM876 RNA, herein designated GAM RNA, and which when bound by GAM876 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM876 target proteins.

[12141] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM876 gene, herein designated GAM GENE, on one or more GAM876 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12142] It is yet further appreciated that specific functions, and accordingly utilities, of GAM876 correlate with, and may be deduced from, the identity of the target genes which GAM876 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12143] Nucleotide sequences of the GAM876 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM876 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM876 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM876 are further described hereinbelow with reference to Table 1.

[12144] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM876 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12145] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 877 (GAM877) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12146] GAM877 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM877 was detected is described hereinabove with reference to Figs. 2-8.

[12147] GAM877 gene, herein designated GAM GENE, and GAM877 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12148] GAM877 gene, herein designated GAM GENE, encodes a GAM877 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM877 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM877 precursor RNA is designated SEQ ID:854, and is provided hereinbelow with reference to the sequence listing part.

[12149] GAM877 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM877 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12150] An enzyme complex designated DICER COMPLEX, dices the GAM877 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM877 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM877 RNA is designated SEQ ID:3457, and is provided hereinbelow with reference to the sequence listing part.

[12151] GAM877 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM877 target RNA, herein designated GAM TARGET RNA. GAM877 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12152] GAM877 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM877

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM877 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM877 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM877 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12153] The complementary binding of GAM877 RNA, herein designated GAM RNA, to target binding sites on GAM877 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM877 target RNA, herein designated GAM TARGET RNA, into GAM877 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12154] It is appreciated that GAM877 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM877 target genes. The mRNA of each one of this plurality of GAM877 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM877 RNA, herein designated GAM RNA, and which when bound by GAM877 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM877 target proteins.

[12155] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM877 gene, herein designated GAM GENE, on one or more GAM877 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12156] It is yet further appreciated that specific functions, and accordingly utilities, of GAM877 correlate with, and may be deduced from, the identity of the target genes which GAM877 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12157] Nucleotide sequences of the GAM877 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM877 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM877 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM877 are further described hereinbelow with

reference to Table 1.

[12158] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM877 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12159] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 878 (GAM878) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12160] GAM878 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM878 was detected is described hereinabove with reference to Figs. 2-8.

[12161] GAM878 gene, herein designated GAM GENE, and GAM878 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12162] GAM878 gene, herein designated GAM GENE, encodes a GAM878 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM878 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM878 precursor RNA is designated SEQ ID:855, and is provided

hereinbelow with reference to the sequence listing part.

[12163] GAM878 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM878 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12164] An enzyme complex designated DICER COMPLEX, dices the GAM878 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM878 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of GAM878 RNA is designated SEQ ID:3455, and is provided hereinbelow with reference to the sequence listing part.

[12165] GAM878 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM878 target RNA, herein designated GAM TARGET RNA. GAM878 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[12166] GAM878 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM878 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM878 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM878 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM878 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12167] The complementary binding of GAM878 RNA, herein designated GAM RNA, to target binding sites on GAM878 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM878 target RNA, herein designated GAM TARGET RNA, into GAM878 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12168] It is appreciated that GAM878 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM878 target genes. The mRNA of each one of this plurality of GAM878 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM878 RNA, herein designated GAM RNA, and which when bound by GAM878 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM878 target proteins.

[12169] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM878 gene, herein designated GAM GENE, on one or more GAM878 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12170] It is yet further appreciated that specific functions, and accordingly utilities, of GAM878 correlate with, and may be deduced from, the identity of the target genes which GAM878 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12171] Nucleotide sequences of the GAM878 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM878 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM878 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM878 are further described hereinbelow with reference to Table 1.

[12172] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM878 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12173] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 879 (GAM879) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12174] GAM879 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM879 was detected is described hereinabove with reference to Figs. 2-8.

[12175] GAM879 gene, herein designated GAM GENE, and GAM879 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12176] GAM879 gene, herein designated GAM GENE, encodes a GAM879 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM879 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM879 precursor RNA is designated SEQ ID:856, and is provided hereinbelow with reference to the sequence listing part.

[12177] GAM879 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM879 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12178] An enzyme complex designated DICER COMPLEX, dices the GAM879 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM879 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM879 RNA is designated SEQ ID:3458, and is provided hereinbelow with reference to the sequence listing part.

[12179] GAM879 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM879 target RNA, herein designated

GAM TARGET RNA. GAM879 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12180] GAM879 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM879 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM879 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM879 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM879 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12181] The complementary binding of GAM879 RNA, herein designated GAM RNA, to target binding sites on GAM879 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM879 target RNA, herein designated GAM

TARGET RNA, into GAM879 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12182] It is appreciated that GAM879 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM879 target genes. The mRNA of each one of this plurality of GAM879 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM879 RNA, herein designated GAM RNA, and which when bound by GAM879 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM879 target proteins.

[12183] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM879 gene, herein designated GAM GENE, on one or more GAM879 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12184] It is yet further appreciated that specific functions, and accordingly utilities, of GAM879 correlate with, and may be deduced from, the identity of the target

genes which GAM879 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12185] Nucleotide sequences of the GAM879 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM879 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM879 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM879 are further described hereinbelow with reference to Table 1.

[12186] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM879 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12187] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 880 (GAM880) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12188] GAM880 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM880 was detected is described hereinabove with reference to Figs. 2-8.

[12189] GAM880 gene, herein designated GAM GENE, and GAM880 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[12190] GAM880 gene, herein designated GAM GENE, encodes a GAM880 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM880 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM880 precursor RNA is designated SEQ ID:857, and is provided hereinbelow with reference to the sequence listing part.

[12191] GAM880 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM880 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12192] An enzyme complex designated DICER COMPLEX, dices the GAM880 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM880 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM880 RNA is designated SEQ ID:3459, and is provided

hereinbelow with reference to the sequence listing part.

[12193] GAM880 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM880 target RNA, herein designated GAM TARGET RNA. GAM880 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12194] GAM880 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM880 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM880 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM880 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM880 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12195] The complementary binding of GAM880 RNA, herein designated GAM RNA, to target binding sites on GAM880 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM880 target RNA, herein designated GAM TARGET RNA, into GAM880 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12196] It is appreciated that GAM880 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM880 target genes. The mRNA of each one of this plurality of GAM880 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM880 RNA, herein designated GAM RNA, and which when bound by GAM880 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM880 target proteins.

[12197] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM880 gene, herein designated GAM GENE, on one or more GAM880 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12198] It is yet further appreciated that specific functions, and accordingly utilities, of GAM880 correlate with, and may be deduced from, the identity of the target genes which GAM880 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12199] Nucleotide sequences of the GAM880 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM880 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM880 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM880 are further described hereinbelow with reference to Table 1.

[12200] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM880 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12201] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 881 (GAM881) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12202] GAM881 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM881 was detected is

described hereinabove with reference to Figs. 2-8.

[12203] GAM881 gene, herein designated GAM GENE, and GAM881 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12204] GAM881 gene, herein designated GAM GENE, encodes a GAM881 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM881 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM881 precursor RNA is designated SEQ ID:858, and is provided hereinbelow with reference to the sequence listing part.

[12205] GAM881 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM881 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12206] An enzyme complex designated DICER COMPLEX, dices the GAM881 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM881 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM881 RNA is designated SEQ ID:3460, and is provided hereinbelow with reference to the sequence listing part.

[12207] GAM881 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM881 target RNA, herein designated GAM TARGET RNA. GAM881 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12208] GAM881 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM881 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM881 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM881 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM881 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12209] The complementary binding of GAM881 RNA, herein designated GAM RNA, to target binding sites on GAM881 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM881 target RNA, herein designated GAM TARGET RNA, into GAM881 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12210] It is appreciated that GAM881 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM881 target genes. The mRNA of each one of this plurality of GAM881 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM881 RNA, herein designated GAM RNA, and which when bound by GAM881 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM881 target proteins.

[12211] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM881 gene, herein designated GAM GENE, on one or more GAM881 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12212] It is yet further appreciated that specific functions, and accordingly utilities, of GAM881 correlate with, and may be deduced from, the identity of the target genes which GAM881 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12213] Nucleotide sequences of the GAM881 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM881 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM881 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM881 are further described hereinbelow with reference to Table 1.

[12214] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM881 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12215] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 882 (GAM882) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12216] GAM882 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM882 was detected is described hereinabove with reference to Figs. 2-8.

[12217] GAM882 gene, herein designated GAM GENE, and GAM882 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12218] GAM882 gene, herein designated GAM GENE, encodes a GAM882 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM882 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM882 precursor RNA is designated SEQ ID:859, and is provided hereinbelow with reference to the sequence listing part.

[12219] GAM882 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM882 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12220] An enzyme complex designated DICER COMPLEX, dices the GAM882 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM882 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM882 RNA is designated SEQ ID:3461, and is provided hereinbelow with reference to the sequence listing part.

[12221] GAM882 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM882 target RNA, herein designated GAM TARGET RNA. GAM882 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12222] GAM882 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM882 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM882 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM882 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM882 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12223] The complementary binding of GAM882 RNA, herein designated GAM RNA, to target binding sites on GAM882 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM882 target RNA, herein designated GAM TARGET RNA, into GAM882 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12224] It is appreciated that GAM882 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM882 target genes. The mRNA of each one of this plurality of GAM882 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM882 RNA, herein designated GAM RNA, and which when bound by GAM882 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM882 target proteins.

[12225] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM882 gene, herein designated GAM GENE, on one or more GAM882 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12226] It is yet further appreciated that specific functions, and accordingly utilities, of GAM882 correlate with, and may be deduced from, the identity of the target genes which GAM882 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12227] Nucleotide sequences of the GAM882 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM882 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM882 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM882 are further described hereinbelow with reference to Table 1.

[12228] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM882 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12229] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 883 (GAM883) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12230] GAM883 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM883 was detected is described hereinabove with reference to Figs. 2-8.

[12231] GAM883 gene, herein designated GAM GENE, and GAM883 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12232] GAM883 gene, herein designated GAM GENE, encodes a GAM883 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM883 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM883 precursor RNA is designated SEQ ID:860, and is provided hereinbelow with reference to the sequence listing part.

[12233] GAM883 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM883 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12234] An enzyme complex designated DICER COMPLEX, dices the GAM883 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM883 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM883 RNA is designated SEQ ID:3462, and is provided hereinbelow with reference to the sequence listing part.

[12235] GAM883 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM883 target RNA, herein designated GAM TARGET RNA. GAM883 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12236] GAM883 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM883 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM883 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM883 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM883 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12237] The complementary binding of GAM883 RNA, herein designated GAM RNA, to target binding sites on GAM883 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM883 target RNA, herein designated GAM TARGET RNA, into GAM883 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12238] It is appreciated that GAM883 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM883 target genes. The mRNA of each one of this plurality of GAM883 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM883 RNA, herein designated GAM RNA, and which when bound by GAM883 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM883 target proteins.

[12239] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM883 gene, herein designated GAM GENE, on one or more

GAM883 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12240] It is yet further appreciated that specific functions, and accordingly utilities, of GAM883 correlate with, and may be deduced from, the identity of the target genes which GAM883 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12241] Nucleotide sequences of the GAM883 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM883 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM883 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM883 are further described hereinbelow with reference to Table 1.

[12242] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM883 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12243] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 884 (GAM884) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12244] GAM884 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM884 was detected is described hereinabove with reference to Figs. 2-8.

[12245] GAM884 gene, herein designated GAM GENE, and GAM884 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12246] GAM884 gene, herein designated GAM GENE, encodes a GAM884 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM884 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM884 precursor RNA is designated SEQ ID:861, and is provided hereinbelow with reference to the sequence listing part.

[12247] GAM884 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM884 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12248] An enzyme complex designated DICER COMPLEX, dices the GAM884 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM884 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM884 RNA is designated SEQ ID:3463, and is provided hereinbelow with reference to the sequence listing part.

[12249] GAM884 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM884 target RNA, herein designated GAM TARGET RNA. GAM884 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12250] GAM884 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM884 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM884 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM884 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM884 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12251] The complementary binding of GAM884 RNA, herein designated GAM RNA, to target binding sites on GAM884 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM884 target RNA, herein designated GAM TARGET RNA, into GAM884 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12252] It is appreciated that GAM884 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM884 target genes. The mRNA of each one of this plurality of GAM884 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM884 RNA, herein designated GAM RNA, and which when bound by GAM884 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM884 target proteins.

[12253] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM884 gene, herein designated GAM GENE, on one or more GAM884 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12254] It is yet further appreciated that specific functions, and accordingly utilities, of GAM884 correlate with, and may be deduced from, the identity of the target genes which GAM884 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12255] Nucleotide sequences of the GAM884 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM884 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM884 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM884 are further described hereinbelow with reference to Table 1.

[12256] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM884 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12257] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 885 (GAM885) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12258] GAM885 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM885 was detected is described hereinabove with reference to Figs. 2-8.

[12259] GAM885 gene, herein designated GAM GENE, and GAM885 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12260] GAM885 gene, herein designated GAM GENE, encodes a GAM885 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM885 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM885 precursor RNA is designated SEQ ID:862, and is provided hereinbelow with reference to the sequence listing part.

[12261] GAM885 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM885 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12262] An enzyme complex designated DICER COMPLEX, dices the GAM885 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM885 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer

together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM885 RNA is designated SEQ ID:3464, and is provided hereinbelow with reference to the sequence listing part.

[12263] GAM885 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM885 target RNA, herein designated GAM TARGET RNA. GAM885 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12264] GAM885 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM885 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM885 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM885 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM885 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or

in both 3UTR and 5UTR regions.

[12265] The complementary binding of GAM885 RNA, herein designated GAM RNA, to target binding sites on GAM885 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM885 target RNA, herein designated GAM TARGET RNA, into GAM885 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12266] It is appreciated that GAM885 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM885 target genes. The mRNA of each one of this plurality of GAM885 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM885 RNA, herein designated GAM RNA, and which when bound by GAM885 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM885 target proteins.

[12267] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM885 gene, herein designated GAM GENE, on one or more GAM885 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other

genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12268] It is yet further appreciated that specific functions, and accordingly utilities, of GAM885 correlate with, and may be deduced from, the identity of the target genes which GAM885 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12269] Nucleotide sequences of the GAM885 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM885 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM885 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM885 are further described hereinbelow with reference to Table 1.

[12270] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM885 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12271] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 886 (GAM886) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12272] GAM886 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM886 was detected is described hereinabove with reference to Figs. 2-8.

[12273] GAM886 gene, herein designated GAM GENE, and GAM886 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12274] GAM886 gene, herein designated GAM GENE, encodes a GAM886 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM886 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM886 precursor RNA is designated SEQ ID:863, and is provided hereinbelow with reference to the sequence listing part.

[12275] GAM886 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM886 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12276] An enzyme complex designated DICER COMPLEX, dices the GAM886 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM886 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM886 RNA is designated SEQ ID:3465, and is provided hereinbelow with reference to the sequence listing part.

[12277] GAM886 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM886 target RNA, herein designated GAM TARGET RNA. GAM886 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12278] GAM886 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM886 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM886 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM886 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM886 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12279] The complementary binding of GAM886 RNA, herein designated GAM RNA, to target binding sites on GAM886 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM886 target RNA, herein designated GAM TARGET RNA, into GAM886 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12280] It is appreciated that GAM886 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM886 target genes. The mRNA of each one of this plurality of GAM886 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM886 RNA, herein designated GAM RNA, and which when bound by GAM886 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM886 target proteins.

[12281] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM886 gene, herein designated GAM GENE, on one or more GAM886 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12282] It is yet further appreciated that specific functions, and accordingly utilities, of GAM886 correlate with, and may be deduced from, the identity of the target genes which GAM886 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12283] Nucleotide sequences of the GAM886 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM886 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM886 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM886 are further described hereinbelow with reference to Table 1.

[12284] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM886 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12285] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 887 (GAM887) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12286] GAM887 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM887 was detected is described hereinabove with reference to Figs. 2-8.

[12287] GAM887 gene, herein designated GAM GENE, and GAM887 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12288] GAM887 gene, herein designated GAM GENE, encodes a GAM887 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM887 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM887 precursor RNA is designated SEQ ID:864, and is provided hereinbelow with reference to the sequence listing part.

[12289] GAM887 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12290] An enzyme complex designated DICER COMPLEX, dices the GAM887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM887 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM887 RNA is designated SEQ ID:3466, and is provided hereinbelow with reference to the sequence listing part.

[12291] GAM887 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM887 target RNA, herein designated GAM TARGET RNA. GAM887 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12292] GAM887 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM887 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM887 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM887 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM887 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12293] The complementary binding of GAM887 RNA, herein designated GAM RNA, to target binding sites on GAM887 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM887 target RNA, herein designated GAM TARGET RNA, into GAM887 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12294] It is appreciated that GAM887 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM887 target genes. The mRNA of each one of this plurality of GAM887 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM887 RNA, herein designated GAM RNA, and which when bound by GAM887 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM887 target proteins.

[12295] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM887 gene, herein designated GAM GENE, on one or more

GAM887 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12296] It is yet further appreciated that specific functions, and accordingly utilities, of GAM887 correlate with, and may be deduced from, the identity of the target genes which GAM887 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12297] Nucleotide sequences of the GAM887 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM887 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM887 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM887 are further described hereinbelow with reference to Table 1.

[12298] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM887 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12299] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 888 (GAM888) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12300] GAM888 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM888 was detected is described hereinabove with reference to Figs. 2-8.

[12301] GAM888 gene, herein designated GAM GENE, and GAM888 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12302] GAM888 gene, herein designated GAM GENE, encodes a GAM888 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM888 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM888 precursor RNA is designated SEQ ID:865, and is provided hereinbelow with reference to the sequence listing part.

[12303] GAM888 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM888 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12304] An enzyme complex designated DICER COMPLEX, dices the GAM888 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM888 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM888 RNA is designated SEQ ID:3467, and is provided hereinbelow with reference to the sequence listing part.

[12305] GAM888 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM888 target RNA, herein designated GAM TARGET RNA. GAM888 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12306] GAM888 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM888 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM888 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM888 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM888 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12307] The complementary binding of GAM888 RNA, herein designated GAM RNA, to target binding sites on GAM888 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM888 target RNA, herein designated GAM TARGET RNA, into GAM888 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12308] It is appreciated that GAM888 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM888 target genes. The mRNA of each one of this plurality of GAM888 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM888 RNA, herein designated GAM RNA, and which when bound by GAM888 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM888 target proteins.

[12309] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM888 gene, herein designated GAM GENE, on one or more GAM888 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12310] It is yet further appreciated that specific functions, and accordingly utilities, of GAM888 correlate with, and may be deduced from, the identity of the target genes which GAM888 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12311] Nucleotide sequences of the GAM888 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM888 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM888 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM888 are further described hereinbelow with reference to Table 1.

[12312] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM888 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12313] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 889 (GAM889) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12314] GAM889 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM889 was detected is described hereinabove with reference to Figs. 2-8.

[12315] GAM889 gene, herein designated GAM GENE, and GAM889 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12316] GAM889 gene, herein designated GAM GENE, encodes a GAM889 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM889 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM889 precursor RNA is designated SEQ ID:866, and is provided hereinbelow with reference to the sequence listing part.

[12317] GAM889 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM889 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12318] An enzyme complex designated DICER COMPLEX, dices the GAM889 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM889 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM889 RNA is designated SEQ ID:3468, and is provided hereinbelow with reference to the sequence listing part.

[12319] GAM889 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM889 target RNA, herein designated GAM TARGET RNA. GAM889 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12320] GAM889 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM889

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM889 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM889 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM889 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12321] The complementary binding of GAM889 RNA, herein designated GAM RNA, to target binding sites on GAM889 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM889 target RNA, herein designated GAM TARGET RNA, into GAM889 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12322] It is appreciated that GAM889 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM889 target genes. The mRNA of each one of this plurality of GAM889 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM889 RNA, herein designated GAM RNA, and which when bound by GAM889 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM889 target proteins.

[12323] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM889 gene, herein designated GAM GENE, on one or more GAM889 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12324] It is yet further appreciated that specific functions, and accordingly utilities, of GAM889 correlate with, and may be deduced from, the identity of the target genes which GAM889 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12325] Nucleotide sequences of the GAM889 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM889 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM889 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM889 are further described hereinbelow with

reference to Table 1.

[12326] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM889 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12327] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 890 (GAM890) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12328] GAM890 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM890 was detected is described hereinabove with reference to Figs. 2-8.

[12329] GAM890 gene, herein designated GAM GENE, and GAM890 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12330] GAM890 gene, herein designated GAM GENE, encodes a GAM890 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM890 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM890 precursor RNA is designated SEQ ID:867, and is provided

hereinbelow with reference to the sequence listing part.

[12331] GAM890 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM890 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12332] An enzyme complex designated DICER COMPLEX, dices the GAM890 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM890 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM890 RNA is designated SEQ ID:3470, and is provided hereinbelow with reference to the sequence listing part.

[12333] GAM890 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM890 target RNA, herein designated GAM TARGET RNA. GAM890 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[12334] GAM890 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM890 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM890 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM890 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM890 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12335] The complementary binding of GAM890 RNA, herein designated GAM RNA, to target binding sites on GAM890 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM890 target RNA, herein designated GAM TARGET RNA, into GAM890 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12336] It is appreciated that GAM890 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM890 target genes. The mRNA of each one of this plurality of GAM890 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM890 RNA, herein designated GAM RNA, and which when bound by GAM890 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM890 target proteins.

[12337] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM890 gene, herein designated GAM GENE, on one or more GAM890 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12338] It is yet further appreciated that specific functions, and accordingly utilities, of GAM890 correlate with, and may be deduced from, the identity of the target genes which GAM890 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12339] Nucleotide sequences of the GAM890 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM890 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM890 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM890 are further described hereinbelow with reference to Table 1.

[12340] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM890 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12341] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 891 (GAM891) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12342] GAM891 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM891 was detected is described hereinabove with reference to Figs. 2-8.

[12343] GAM891 gene, herein designated GAM GENE, and GAM891 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12344] GAM891 gene, herein designated GAM GENE, encodes a GAM891 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM891 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM891 precursor RNA is designated SEQ ID:868, and is provided hereinbelow with reference to the sequence listing part.

[12345] GAM891 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM891 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12346] An enzyme complex designated DICER COMPLEX, dices the GAM891 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM891 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM891 RNA is designated SEQ ID:3469, and is provided hereinbelow with reference to the sequence listing part.

[12347] GAM891 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM891 target RNA, herein designated

GAM TARGET RNA. GAM891 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12348] GAM891 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM891 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM891 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM891 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM891 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12349] The complementary binding of GAM891 RNA, herein designated GAM RNA, to target binding sites on GAM891 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM891 target RNA, herein designated GAM

TARGET RNA, into GAM891 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12350] It is appreciated that GAM891 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM891 target genes. The mRNA of each one of this plurality of GAM891 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM891 RNA, herein designated GAM RNA, and which when bound by GAM891 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM891 target proteins.

[12351] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM891 gene, herein designated GAM GENE, on one or more GAM891 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12352] It is yet further appreciated that specific functions, and accordingly utilities, of GAM891 correlate with, and may be deduced from, the identity of the target

genes which GAM891 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12353] Nucleotide sequences of the GAM891 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM891 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM891 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM891 are further described hereinbelow with reference to Table 1.

[12354] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM891 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12355] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 892 (GAM892) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12356] GAM892 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM892 was detected is described hereinabove with reference to Figs. 2-8.

[12357] GAM892 gene, herein designated GAM GENE, and GAM892 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[12358] GAM892 gene, herein designated GAM GENE, encodes a GAM892 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM892 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM892 precursor RNA is designated SEQ ID:869, and is provided hereinbelow with reference to the sequence listing part.

[12359] GAM892 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM892 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12360] An enzyme complex designated DICER COMPLEX, dices the GAM892 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM892 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM892 RNA is designated SEQ ID:3471, and is provided

hereinbelow with reference to the sequence listing part.

[12361] GAM892 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM892 target RNA, herein designated GAM TARGET RNA. GAM892 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12362] GAM892 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM892 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM892 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM892 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM892 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12363] The complementary binding of GAM892 RNA, herein designated GAM RNA, to target binding sites on GAM892 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM892 target RNA, herein designated GAM TARGET RNA, into GAM892 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12364] It is appreciated that GAM892 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM892 target genes. The mRNA of each one of this plurality of GAM892 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM892 RNA, herein designated GAM RNA, and which when bound by GAM892 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM892 target proteins.

[12365] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM892 gene, herein designated GAM GENE, on one or more GAM892 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12366] It is yet further appreciated that specific functions, and accordingly utilities, of GAM892 correlate with, and may be deduced from, the identity of the target genes which GAM892 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12367] Nucleotide sequences of the GAM892 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM892 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM892 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM892 are further described hereinbelow with reference to Table 1.

[12368] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM892 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12369] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 893 (GAM893) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12370] GAM893 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM893 was detected is

described hereinabove with reference to Figs. 2-8.

[12371] GAM893 gene, herein designated GAM GENE, and GAM893 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12372] GAM893 gene, herein designated GAM GENE, encodes a GAM893 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM893 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM893 precursor RNA is designated SEQ ID:870, and is provided hereinbelow with reference to the sequence listing part.

[12373] GAM893 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM893 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12374] An enzyme complex designated DICER COMPLEX, dices the GAM893 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM893 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM893 RNA is designated SEQ ID:3472, and is provided hereinbelow with reference to the sequence listing part.

[12375] GAM893 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM893 target RNA, herein designated GAM TARGET RNA. GAM893 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12376] GAM893 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM893 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM893 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM893 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM893 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12377] The complementary binding of GAM893 RNA, herein designated GAM RNA, to target binding sites on GAM893 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM893 target RNA, herein designated GAM TARGET RNA, into GAM893 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12378] It is appreciated that GAM893 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM893 target genes. The mRNA of each one of this plurality of GAM893 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM893 RNA, herein designated GAM RNA, and which when bound by GAM893 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM893 target proteins.

[12379] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM893 gene, herein designated GAM GENE, on one or more GAM893 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12380] It is yet further appreciated that specific functions, and accordingly utilities, of GAM893 correlate with, and may be deduced from, the identity of the target genes which GAM893 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12381] Nucleotide sequences of the GAM893 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM893 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM893 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM893 are further described hereinbelow with reference to Table 1.

[12382] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM893 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12383] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 894 (GAM894) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12384] GAM894 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM894 was detected is described hereinabove with reference to Figs. 2-8.

[12385] GAM894 gene, herein designated GAM GENE, and GAM894 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12386] GAM894 gene, herein designated GAM GENE, encodes a GAM894 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM894 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM894 precursor RNA is designated SEQ ID:871, and is provided hereinbelow with reference to the sequence listing part.

[12387] GAM894 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM894 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12388] An enzyme complex designated DICER COMPLEX, dices the GAM894 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM894 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of GAM894 RNA is designated SEQ ID:3473, and is provided hereinbelow with reference to the sequence listing part.

[12389] GAM894 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM894 target RNA, herein designated GAM TARGET RNA. GAM894 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12390] GAM894 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM894 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM894 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM894 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM894 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12391] The complementary binding of GAM894 RNA, herein designated GAM RNA, to target binding sites on GAM894 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM894 target RNA, herein designated GAM TARGET RNA, into GAM894 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12392] It is appreciated that GAM894 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM894 target genes. The mRNA of each one of this plurality of GAM894 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM894 RNA, herein designated GAM RNA, and which when bound by GAM894 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM894 target proteins.

[12393] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM894 gene, herein designated GAM GENE, on one or more GAM894 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12394] It is yet further appreciated that specific functions, and accordingly utilities, of GAM894 correlate with, and may be deduced from, the identity of the target genes which GAM894 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12395] Nucleotide sequences of the GAM894 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM894 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM894 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM894 are further described hereinbelow with reference to Table 1.

[12396] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM894 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12397] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 895 (GAM895) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12398] GAM895 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM895 was detected is described hereinabove with reference to Figs. 2-8.

[12399] GAM895 gene, herein designated GAM GENE, and GAM895 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12400] GAM895 gene, herein designated GAM GENE, encodes a GAM895 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM895 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM895 precursor RNA is designated SEQ ID:872, and is provided hereinbelow with reference to the sequence listing part.

[12401] GAM895 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM895 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12402] An enzyme complex designated DICER COMPLEX, dices the GAM895 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM895 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM895 RNA is designated SEQ ID:3474, and is provided hereinbelow with reference to the sequence listing part.

[12403] GAM895 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM895 target RNA, herein designated GAM TARGET RNA. GAM895 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12404] GAM895 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM895 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM895 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM895 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM895 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12405] The complementary binding of GAM895 RNA, herein designated GAM RNA, to target binding sites on GAM895 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM895 target RNA, herein designated GAM TARGET RNA, into GAM895 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12406] It is appreciated that GAM895 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM895 target genes. The mRNA of each one of this plurality of GAM895 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM895 RNA, herein designated GAM RNA, and which when bound by GAM895 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM895 target proteins.

[12407] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM895 gene, herein designated GAM GENE, on one or more

GAM895 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12408] It is yet further appreciated that specific functions, and accordingly utilities, of GAM895 correlate with, and may be deduced from, the identity of the target genes which GAM895 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12409] Nucleotide sequences of the GAM895 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM895 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM895 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM895 are further described hereinbelow with reference to Table 1.

[12410] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM895 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12411] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 896 (GAM896) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12412] GAM896 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM896 was detected is described hereinabove with reference to Figs. 2-8.

[12413] GAM896 gene, herein designated GAM GENE, and GAM896 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12414] GAM896 gene, herein designated GAM GENE, encodes a GAM896 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM896 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM896 precursor RNA is designated SEQ ID:873, and is provided hereinbelow with reference to the sequence listing part.

[12415] GAM896 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM896 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12416] An enzyme complex designated DICER COMPLEX, dices the GAM896 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM896 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM896 RNA is designated SEQ ID:3475, and is provided hereinbelow with reference to the sequence listing part.

[12417] GAM896 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM896 target RNA, herein designated GAM TARGET RNA. GAM896 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12418] GAM896 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM896 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM896 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM896 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM896 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12419] The complementary binding of GAM896 RNA, herein designated GAM RNA, to target binding sites on GAM896 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM896 target RNA, herein designated GAM TARGET RNA, into GAM896 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12420] It is appreciated that GAM896 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM896 target genes. The mRNA of each one of this plurality of GAM896 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM896 RNA, herein designated GAM RNA, and which when bound by GAM896 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM896 target proteins.

[12421] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM896 gene, herein designated GAM GENE, on one or more GAM896 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12422] It is yet further appreciated that specific functions, and accordingly utilities, of GAM896 correlate with, and may be deduced from, the identity of the target genes which GAM896 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12423] Nucleotide sequences of the GAM896 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM896 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM896 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM896 are further described hereinbelow with reference to Table 1.

[12424] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM896 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12425] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 897 (GAM897) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12426] GAM897 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM897 was detected is described hereinabove with reference to Figs. 2-8.

[12427] GAM897 gene, herein designated GAM GENE, and GAM897 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12428] GAM897 gene, herein designated GAM GENE, encodes a GAM897 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM897 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM897 precursor RNA is designated SEQ ID:874, and is provided hereinbelow with reference to the sequence listing part.

[12429] GAM897 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM897 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12430] An enzyme complex designated DICER COMPLEX, dices the GAM897 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM897 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of GAM897 RNA is designated SEQ ID:3476, and is provided hereinbelow with reference to the sequence listing part.

[12431] GAM897 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM897 target RNA, herein designated GAM TARGET RNA. GAM897 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12432] GAM897 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM897

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM897 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM897 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM897 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12433] The complementary binding of GAM897 RNA, herein designated GAM RNA, to target binding sites on GAM897 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM897 target RNA, herein designated GAM TARGET RNA, into GAM897 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12434] It is appreciated that GAM897 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM897 target genes. The mRNA of each one of this plurality of GAM897 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM897 RNA, herein designated GAM RNA, and which when bound by GAM897 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM897 target proteins.

[12435] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM897 gene, herein designated GAM GENE, on one or more GAM897 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12436] It is yet further appreciated that specific functions, and accordingly utilities, of GAM897 correlate with, and may be deduced from, the identity of the target genes which GAM897 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12437] Nucleotide sequences of the GAM897 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM897 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM897 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM897 are further described hereinbelow with

reference to Table 1.

[12438] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM897 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12439] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 898 (GAM898) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12440] GAM898 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM898 was detected is described hereinabove with reference to Figs. 2-8.

[12441] GAM898 gene, herein designated GAM GENE, and GAM898 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12442] GAM898 gene, herein designated GAM GENE, encodes a GAM898 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM898 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM898 precursor RNA is designated SEQ ID:875, and is provided

hereinbelow with reference to the sequence listing part.

[12443] GAM898 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM898 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12444] An enzyme complex designated DICER COMPLEX, dices the GAM898 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM898 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM898 RNA is designated SEQ ID:3477, and is provided hereinbelow with reference to the sequence listing part.

[12445] GAM898 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM898 target RNA, herein designated GAM TARGET RNA. GAM898 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[12446] GAM898 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM898 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM898 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM898 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM898 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12447] The complementary binding of GAM898 RNA, herein designated GAM RNA, to target binding sites on GAM898 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM898 target RNA, herein designated GAM TARGET RNA, into GAM898 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12448] It is appreciated that GAM898 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM898 target genes. The mRNA of each one of this plurality of GAM898 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM898 RNA, herein designated GAM RNA, and which when bound by GAM898 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM898 target proteins.

[12449] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM898 gene, herein designated GAM GENE, on one or more GAM898 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12450] It is yet further appreciated that specific functions, and accordingly utilities, of GAM898 correlate with, and may be deduced from, the identity of the target genes which GAM898 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12451] Nucleotide sequences of the GAM898 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM898 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM898 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM898 are further described hereinbelow with reference to Table 1.

[12452] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM898 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12453] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 899 (GAM899) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12454] GAM899 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM899 was detected is described hereinabove with reference to Figs. 2-8.

[12455] GAM899 gene, herein designated GAM GENE, and GAM899 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12456] GAM899 gene, herein designated GAM GENE, encodes a GAM899 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM899 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM899 precursor RNA is designated SEQ ID:876, and is provided hereinbelow with reference to the sequence listing part.

[12457] GAM899 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM899 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12458] An enzyme complex designated DICER COMPLEX, dices the GAM899 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM899 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of GAM899 RNA is designated SEQ ID:3478, and is provided hereinbelow with reference to the sequence listing part.

[12459] GAM899 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM899 target RNA, herein designated

GAM TARGET RNA. GAM899 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12460] GAM899 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM899 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM899 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM899 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM899 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12461] The complementary binding of GAM899 RNA, herein designated GAM RNA, to target binding sites on GAM899 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM899 target RNA, herein designated GAM

TARGET RNA, into GAM899 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12462] It is appreciated that GAM899 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM899 target genes. The mRNA of each one of this plurality of GAM899 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM899 RNA, herein designated GAM RNA, and which when bound by GAM899 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM899 target proteins.

[12463] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM899 gene, herein designated GAM GENE, on one or more GAM899 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12464] It is yet further appreciated that specific functions, and accordingly utilities, of GAM899 correlate with, and may be deduced from, the identity of the target

genes which GAM899 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12465] Nucleotide sequences of the GAM899 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM899 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM899 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM899 are further described hereinbelow with reference to Table 1.

[12466] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM899 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12467] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 900 (GAM900) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12468] GAM900 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM900 was detected is described hereinabove with reference to Figs. 2-8.

[12469] GAM900 gene, herein designated GAM GENE, and GAM900 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[12470] GAM900 gene, herein designated GAM GENE, encodes a GAM900 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM900 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM900 precursor RNA is designated SEQ ID:877, and is provided hereinbelow with reference to the sequence listing part.

[12471] GAM900 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM900 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12472] An enzyme complex designated DICER COMPLEX, dices the GAM900 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM900 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM900 RNA is designated SEQ ID:3479, and is provided

hereinbelow with reference to the sequence listing part.

[12473] GAM900 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM900 target RNA, herein designated GAM TARGET RNA. GAM900 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12474] GAM900 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM900 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM900 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM900 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM900 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12475] The complementary binding of GAM900 RNA, herein designated GAM RNA, to target binding sites on GAM900 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM900 target RNA, herein designated GAM TARGET RNA, into GAM900 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12476] It is appreciated that GAM900 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM900 target genes. The mRNA of each one of this plurality of GAM900 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM900 RNA, herein designated GAM RNA, and which when bound by GAM900 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM900 target proteins.

[12477] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM900 gene, herein designated GAM GENE, on one or more GAM900 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12478] It is yet further appreciated that specific functions, and accordingly utilities, of GAM900 correlate with, and may be deduced from, the identity of the target genes which GAM900 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12479] Nucleotide sequences of the GAM900 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM900 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM900 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM900 are further described hereinbelow with reference to Table 1.

[12480] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM900 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12481] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 901 (GAM901) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12482] GAM901 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM901 was detected is

described hereinabove with reference to Figs. 2-8.

[12483] GAM901 gene, herein designated GAM GENE, and GAM901 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12484] GAM901 gene, herein designated GAM GENE, encodes a GAM901 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM901 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM901 precursor RNA is designated SEQ ID:878, and is provided hereinbelow with reference to the sequence listing part.

[12485] GAM901 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM901 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12486] An enzyme complex designated DICER COMPLEX, dices the GAM901 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM901 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of GAM901 RNA is designated SEQ ID:3481, and is provided hereinbelow with reference to the sequence listing part.

[12487] GAM901 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM901 target RNA, herein designated GAM TARGET RNA. GAM901 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12488] GAM901 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM901 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM901 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM901 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM901 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12489] The complementary binding of GAM901 RNA, herein designated GAM RNA, to target binding sites on GAM901 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM901 target RNA, herein designated GAM TARGET RNA, into GAM901 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12490] It is appreciated that GAM901 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM901 target genes. The mRNA of each one of this plurality of GAM901 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM901 RNA, herein designated GAM RNA, and which when bound by GAM901 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM901 target proteins.

[12491] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM901 gene, herein designated GAM GENE, on one or more GAM901 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12492] It is yet further appreciated that specific functions, and accordingly utilities, of GAM901 correlate with, and may be deduced from, the identity of the target genes which GAM901 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12493] Nucleotide sequences of the GAM901 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM901 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM901 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM901 are further described hereinbelow with reference to Table 1.

[12494] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM901 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12495] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 902 (GAM902) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12496] GAM902 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM902 was detected is described hereinabove with reference to Figs. 2-8.

[12497] GAM902 gene, herein designated GAM GENE, and GAM902 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12498] GAM902 gene, herein designated GAM GENE, encodes a GAM902 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM902 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM902 precursor RNA is designated SEQ ID:879, and is provided hereinbelow with reference to the sequence listing part.

[12499] GAM902 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM902 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12500] An enzyme complex designated DICER COMPLEX, dices the GAM902 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM902 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of GAM902 RNA is designated SEQ ID:3480, and is provided hereinbelow with reference to the sequence listing part.

[12501] GAM902 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM902 target RNA, herein designated GAM TARGET RNA. GAM902 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12502] GAM902 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM902 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM902 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM902 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM902 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12503] The complementary binding of GAM902 RNA, herein designated GAM RNA, to target binding sites on GAM902 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM902 target RNA, herein designated GAM TARGET RNA, into GAM902 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12504] It is appreciated that GAM902 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM902 target genes. The mRNA of each one of this plurality of GAM902 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM902 RNA, herein designated GAM RNA, and which when bound by GAM902 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM902 target proteins.

[12505] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM902 gene, herein designated GAM GENE, on one or more GAM902 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12506] It is yet further appreciated that specific functions, and accordingly utilities, of GAM902 correlate with, and may be deduced from, the identity of the target genes which GAM902 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12507] Nucleotide sequences of the GAM902 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM902 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM902 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM902 are further described hereinbelow with reference to Table 1.

[12508] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM902 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12509] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 903 (GAM903) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12510] GAM903 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM903 was detected is described hereinabove with reference to Figs. 2-8.

[12511] GAM903 gene, herein designated GAM GENE, and GAM903 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12512] GAM903 gene, herein designated GAM GENE, encodes a GAM903 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM903 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM903 precursor RNA is designated SEQ ID:880, and is provided hereinbelow with reference to the sequence listing part.

[12513] GAM903 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM903 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12514] An enzyme complex designated DICER COMPLEX, dices the GAM903 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM903 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM903 RNA is designated SEQ ID:3482, and is provided hereinbelow with reference to the sequence listing part.

[12515] GAM903 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM903 target RNA, herein designated GAM TARGET RNA. GAM903 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12516] GAM903 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM903 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM903 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM903 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM903 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12517] The complementary binding of GAM903 RNA, herein designated GAM RNA, to target binding sites on GAM903 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM903 target RNA, herein designated GAM TARGET RNA, into GAM903 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12518] It is appreciated that GAM903 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM903 target genes. The mRNA of each one of this plurality of GAM903 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM903 RNA, herein designated GAM RNA, and which when bound by GAM903 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM903 target proteins.

[12519] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM903 gene, herein designated GAM GENE, on one or more

GAM903 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12520] It is yet further appreciated that specific functions, and accordingly utilities, of GAM903 correlate with, and may be deduced from, the identity of the target genes which GAM903 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12521] Nucleotide sequences of the GAM903 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM903 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM903 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM903 are further described hereinbelow with reference to Table 1.

[12522] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM903 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12523] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 904 (GAM904) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12524] GAM904 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM904 was detected is described hereinabove with reference to Figs. 2-8.

[12525] GAM904 gene, herein designated GAM GENE, and GAM904 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12526] GAM904 gene, herein designated GAM GENE, encodes a GAM904 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM904 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM904 precursor RNA is designated SEQ ID:881, and is provided hereinbelow with reference to the sequence listing part.

[12527] GAM904 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM904 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12528] An enzyme complex designated DICER COMPLEX, dices the GAM904 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM904 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM904 RNA is designated SEQ ID:3483, and is provided hereinbelow with reference to the sequence listing part.

[12529] GAM904 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM904 target RNA, herein designated GAM TARGET RNA. GAM904 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12530] GAM904 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM904 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM904 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM904 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM904 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12531] The complementary binding of GAM904 RNA, herein designated GAM RNA, to target binding sites on GAM904 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM904 target RNA, herein designated GAM TARGET RNA, into GAM904 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12532] It is appreciated that GAM904 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM904 target genes. The mRNA of each one of this plurality of GAM904 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM904 RNA, herein designated GAM RNA, and which when bound by GAM904 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM904 target proteins.

[12533] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM904 gene, herein designated GAM GENE, on one or more GAM904 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12534] It is yet further appreciated that specific functions, and accordingly utilities, of GAM904 correlate with, and may be deduced from, the identity of the target genes which GAM904 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12535] Nucleotide sequences of the GAM904 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM904 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM904 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM904 are further described hereinbelow with reference to Table 1.

[12536] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM904 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12537] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 905 (GAM905) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12538] GAM905 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM905 was detected is described hereinabove with reference to Figs. 2-8.

[12539] GAM905 gene, herein designated GAM GENE, and GAM905 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12540] GAM905 gene, herein designated GAM GENE, encodes a GAM905 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM905 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM905 precursor RNA is designated SEQ ID:882, and is provided hereinbelow with reference to the sequence listing part.

[12541] GAM905 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM905 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12542] An enzyme complex designated DICER COMPLEX, dices the GAM905 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM905 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM905 RNA is designated SEQ ID:3484, and is provided hereinbelow with reference to the sequence listing part.

[12543] GAM905 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM905 target RNA, herein designated GAM TARGET RNA. GAM905 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12544] GAM905 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM905

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM905 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM905 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM905 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12545] The complementary binding of GAM905 RNA, herein designated GAM RNA, to target binding sites on GAM905 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM905 target RNA, herein designated GAM TARGET RNA, into GAM905 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12546] It is appreciated that GAM905 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM905 target genes. The mRNA of each one of this plurality of GAM905 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM905 RNA, herein designated GAM RNA, and which when bound by GAM905 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM905 target proteins.

[12547] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM905 gene, herein designated GAM GENE, on one or more GAM905 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12548] It is yet further appreciated that specific functions, and accordingly utilities, of GAM905 correlate with, and may be deduced from, the identity of the target genes which GAM905 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12549] Nucleotide sequences of the GAM905 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM905 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM905 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM905 are further described hereinbelow with

reference to Table 1.

[12550] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM905 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12551] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 906 (GAM906) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12552] GAM906 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM906 was detected is described hereinabove with reference to Figs. 2-8.

[12553] GAM906 gene, herein designated GAM GENE, and GAM906 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12554] GAM906 gene, herein designated GAM GENE, encodes a GAM906 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM906 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM906 precursor RNA is designated SEQ ID:883, and is provided

hereinbelow with reference to the sequence listing part.

[12555] GAM906 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM906 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12556] An enzyme complex designated DICER COMPLEX, dices the GAM906 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM906 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM906 RNA is designated SEQ ID:3485, and is provided hereinbelow with reference to the sequence listing part.

[12557] GAM906 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM906 target RNA, herein designated GAM TARGET RNA. GAM906 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[12558] GAM906 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM906 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM906 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM906 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM906 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12559] The complementary binding of GAM906 RNA, herein designated GAM RNA, to target binding sites on GAM906 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM906 target RNA, herein designated GAM TARGET RNA, into GAM906 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12560] It is appreciated that GAM906 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM906 target genes. The mRNA of each one of this plurality of GAM906 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM906 RNA, herein designated GAM RNA, and which when bound by GAM906 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM906 target proteins.

[12561] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM906 gene, herein designated GAM GENE, on one or more GAM906 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12562] It is yet further appreciated that specific functions, and accordingly utilities, of GAM906 correlate with, and may be deduced from, the identity of the target genes which GAM906 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12563] Nucleotide sequences of the GAM906 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM906 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM906 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM906 are further described hereinbelow with reference to Table 1.

[12564] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM906 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12565] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 907 (GAM907) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12566] GAM907 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM907 was detected is described hereinabove with reference to Figs. 2-8.

[12567] GAM907 gene, herein designated GAM GENE, and GAM907 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12568] GAM907 gene, herein designated GAM GENE, encodes a GAM907 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM907 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM907 precursor RNA is designated SEQ ID:884, and is provided hereinbelow with reference to the sequence listing part.

[12569] GAM907 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM907 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12570] An enzyme complex designated DICER COMPLEX, dices the GAM907 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM907 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM907 RNA is designated SEQ ID:3486, and is provided hereinbelow with reference to the sequence listing part.

[12571] GAM907 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM907 target RNA, herein designated

GAM TARGET RNA. GAM907 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12572] GAM907 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM907 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM907 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM907 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM907 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12573] The complementary binding of GAM907 RNA, herein designated GAM RNA, to target binding sites on GAM907 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM907 target RNA, herein designated GAM

TARGET RNA, into GAM907 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12574] It is appreciated that GAM907 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM907 target genes. The mRNA of each one of this plurality of GAM907 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM907 RNA, herein designated GAM RNA, and which when bound by GAM907 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM907 target proteins.

[12575] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM907 gene, herein designated GAM GENE, on one or more GAM907 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12576] It is yet further appreciated that specific functions, and accordingly utilities, of GAM907 correlate with, and may be deduced from, the identity of the target

genes which GAM907 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12577] Nucleotide sequences of the GAM907 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM907 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM907 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM907 are further described hereinbelow with reference to Table 1.

[12578] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM907 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12579] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 908 (GAM908) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12580] GAM908 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM908 was detected is described hereinabove with reference to Figs. 2-8.

[12581] GAM908 gene, herein designated GAM GENE, and GAM908 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[12582] GAM908 gene, herein designated GAM GENE, encodes a GAM908 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM908 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM908 precursor RNA is designated SEQ ID:885, and is provided hereinbelow with reference to the sequence listing part.

[12583] GAM908 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM908 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12584] An enzyme complex designated DICER COMPLEX, dices the GAM908 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM908 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM908 RNA is designated SEQ ID:3487, and is provided

hereinbelow with reference to the sequence listing part.

[12585] GAM908 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM908 target RNA, herein designated GAM TARGET RNA. GAM908 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12586] GAM908 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM908 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM908 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM908 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM908 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12587] The complementary binding of GAM908 RNA, herein designated GAM RNA, to target binding sites on GAM908 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM908 target RNA, herein designated GAM TARGET RNA, into GAM908 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12588] It is appreciated that GAM908 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM908 target genes. The mRNA of each one of this plurality of GAM908 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM908 RNA, herein designated GAM RNA, and which when bound by GAM908 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM908 target proteins.

[12589] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM908 gene, herein designated GAM GENE, on one or more GAM908 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12590] It is yet further appreciated that specific functions, and accordingly utilities, of GAM908 correlate with, and may be deduced from, the identity of the target genes which GAM908 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12591] Nucleotide sequences of the GAM908 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM908 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM908 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM908 are further described hereinbelow with reference to Table 1.

[12592] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM908 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12593] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 909 (GAM909) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12594] GAM909 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM909 was detected is

described hereinabove with reference to Figs. 2-8.

[12595] GAM909 gene, herein designated GAM GENE, and GAM909 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12596] GAM909 gene, herein designated GAM GENE, encodes a GAM909 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM909 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM909 precursor RNA is designated SEQ ID:886, and is provided hereinbelow with reference to the sequence listing part.

[12597] GAM909 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM909 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12598] An enzyme complex designated DICER COMPLEX, dices the GAM909 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM909 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM909 RNA is designated SEQ ID:3488, and is provided hereinbelow with reference to the sequence listing part.

[12599] GAM909 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM909 target RNA, herein designated GAM TARGET RNA. GAM909 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12600] GAM909 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM909 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM909 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM909 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM909 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12601] The complementary binding of GAM909 RNA, herein designated GAM RNA, to target binding sites on GAM909 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM909 target RNA, herein designated GAM TARGET RNA, into GAM909 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12602] It is appreciated that GAM909 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM909 target genes. The mRNA of each one of this plurality of GAM909 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM909 RNA, herein designated GAM RNA, and which when bound by GAM909 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM909 target proteins.

[12603] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM909 gene, herein designated GAM GENE, on one or more GAM909 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12604] It is yet further appreciated that specific functions, and accordingly utilities, of GAM909 correlate with, and may be deduced from, the identity of the target genes which GAM909 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12605] Nucleotide sequences of the GAM909 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM909 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM909 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM909 are further described hereinbelow with reference to Table 1.

[12606] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM909 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12607] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 910 (GAM910) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12608] GAM910 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM910 was detected is described hereinabove with reference to Figs. 2-8.

[12609] GAM910 gene, herein designated GAM GENE, and GAM910 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12610] GAM910 gene, herein designated GAM GENE, encodes a GAM910 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM910 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM910 precursor RNA is designated SEQ ID:887, and is provided hereinbelow with reference to the sequence listing part.

[12611] GAM910 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM910 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12612] An enzyme complex designated DICER COMPLEX, dices the GAM910 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM910 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of GAM910 RNA is designated SEQ ID:3489, and is provided hereinbelow with reference to the sequence listing part.

[12613] GAM910 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM910 target RNA, herein designated GAM TARGET RNA. GAM910 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12614] GAM910 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM910 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM910 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM910 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM910 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12615] The complementary binding of GAM910 RNA, herein designated GAM RNA, to target binding sites on GAM910 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM910 target RNA, herein designated GAM TARGET RNA, into GAM910 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12616] It is appreciated that GAM910 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM910 target genes. The mRNA of each one of this plurality of GAM910 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM910 RNA, herein designated GAM RNA, and which when bound by GAM910 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM910 target proteins.

[12617] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM910 gene, herein designated GAM GENE, on one or more GAM910 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12618] It is yet further appreciated that specific functions, and accordingly utilities, of GAM910 correlate with, and may be deduced from, the identity of the target genes which GAM910 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12619] Nucleotide sequences of the GAM910 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM910 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM910 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM910 are further described hereinbelow with reference to Table 1.

[12620] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM910 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12621] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 911 (GAM911) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12622] GAM911 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM911 was detected is described hereinabove with reference to Figs. 2-8.

[12623] GAM911 gene, herein designated GAM GENE, and GAM911 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12624] GAM911 gene, herein designated GAM GENE, encodes a GAM911 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM911 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM911 precursor RNA is designated SEQ ID:888, and is provided hereinbelow with reference to the sequence listing part.

[12625] GAM911 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12626] An enzyme complex designated DICER COMPLEX, dices the GAM911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM911 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM911 RNA is designated SEQ ID:3490, and is provided hereinbelow with reference to the sequence listing part.

[12627] GAM911 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM911 target RNA, herein designated GAM TARGET RNA. GAM911 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12628] GAM911 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM911 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM911 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM911 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM911 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12629] The complementary binding of GAM911 RNA, herein designated GAM RNA, to target binding sites on GAM911 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM911 target RNA, herein designated GAM TARGET RNA, into GAM911 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12630] It is appreciated that GAM911 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM911 target genes. The mRNA of each one of this plurality of GAM911 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM911 RNA, herein designated GAM RNA, and which when bound by GAM911 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM911 target proteins.

[12631] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM911 gene, herein designated GAM GENE, on one or more

GAM911 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12632] It is yet further appreciated that specific functions, and accordingly utilities, of GAM911 correlate with, and may be deduced from, the identity of the target genes which GAM911 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12633] Nucleotide sequences of the GAM911 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM911 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM911 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM911 are further described hereinbelow with reference to Table 1.

[12634] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM911 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12635] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 912 (GAM912) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12636] GAM912 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM912 was detected is described hereinabove with reference to Figs. 2-8.

[12637] GAM912 gene, herein designated GAM GENE, and GAM912 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12638] GAM912 gene, herein designated GAM GENE, encodes a GAM912 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM912 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM912 precursor RNA is designated SEQ ID:889, and is provided hereinbelow with reference to the sequence listing part.

[12639] GAM912 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM912 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12640] An enzyme complex designated DICER COMPLEX, dices the GAM912 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM912 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM912 RNA is designated SEQ ID:3491, and is provided hereinbelow with reference to the sequence listing part.

[12641] GAM912 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM912 target RNA, herein designated GAM TARGET RNA. GAM912 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12642] GAM912 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM912 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM912 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM912 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM912 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12643] The complementary binding of GAM912 RNA, herein designated GAM RNA, to target binding sites on GAM912 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM912 target RNA, herein designated GAM TARGET RNA, into GAM912 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12644] It is appreciated that GAM912 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM912 target genes. The mRNA of each one of this plurality of GAM912 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM912 RNA, herein designated GAM RNA, and which when bound by GAM912 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM912 target proteins.

[12645] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM912 gene, herein designated GAM GENE, on one or more GAM912 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12646] It is yet further appreciated that specific functions, and accordingly utilities, of GAM912 correlate with, and may be deduced from, the identity of the target genes which GAM912 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12647] Nucleotide sequences of the GAM912 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM912 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM912 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM912 are further described hereinbelow with reference to Table 1.

[12648] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM912 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12649] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 913 (GAM913) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12650] GAM913 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM913 was detected is described hereinabove with reference to Figs. 2-8.

[12651] GAM913 gene, herein designated GAM GENE, and GAM913 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12652] GAM913 gene, herein designated GAM GENE, encodes a GAM913 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM913 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM913 precursor RNA is designated SEQ ID:890, and is provided hereinbelow with reference to the sequence listing part.

[12653] GAM913 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM913 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12654] An enzyme complex designated DICER COMPLEX, dices the GAM913 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM913 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM913 RNA is designated SEQ ID:3492, and is provided hereinbelow with reference to the sequence listing part.

[12655] GAM913 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM913 target RNA, herein designated GAM TARGET RNA. GAM913 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12656] GAM913 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM913

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM913 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM913 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM913 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12657] The complementary binding of GAM913 RNA, herein designated GAM RNA, to target binding sites on GAM913 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM913 target RNA, herein designated GAM TARGET RNA, into GAM913 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12658] It is appreciated that GAM913 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM913 target genes. The mRNA of each one of this plurality of GAM913 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM913 RNA, herein designated GAM RNA, and which when bound by GAM913 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM913 target proteins.

[12659] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM913 gene, herein designated GAM GENE, on one or more GAM913 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12660] It is yet further appreciated that specific functions, and accordingly utilities, of GAM913 correlate with, and may be deduced from, the identity of the target genes which GAM913 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12661] Nucleotide sequences of the GAM913 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM913 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM913 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM913 are further described hereinbelow with

reference to Table 1.

[12662] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM913 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12663] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 914 (GAM914) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12664] GAM914 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM914 was detected is described hereinabove with reference to Figs. 2-8.

[12665] GAM914 gene, herein designated GAM GENE, and GAM914 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12666] GAM914 gene, herein designated GAM GENE, encodes a GAM914 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM914 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM914 precursor RNA is designated SEQ ID:891, and is provided

hereinbelow with reference to the sequence listing part.

[12667] GAM914 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM914 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12668] An enzyme complex designated DICER COMPLEX, dices the GAM914 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM914 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM914 RNA is designated SEQ ID:3493, and is provided hereinbelow with reference to the sequence listing part.

[12669] GAM914 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM914 target RNA, herein designated GAM TARGET RNA. GAM914 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[12670] GAM914 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM914 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM914 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM914 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM914 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12671] The complementary binding of GAM914 RNA, herein designated GAM RNA, to target binding sites on GAM914 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM914 target RNA, herein designated GAM TARGET RNA, into GAM914 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12672] It is appreciated that GAM914 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM914 target genes. The mRNA of each one of this plurality of GAM914 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM914 RNA, herein designated GAM RNA, and which when bound by GAM914 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM914 target proteins.

[12673] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM914 gene, herein designated GAM GENE, on one or more GAM914 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12674] It is yet further appreciated that specific functions, and accordingly utilities, of GAM914 correlate with, and may be deduced from, the identity of the target genes which GAM914 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12675] Nucleotide sequences of the GAM914 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM914 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM914 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM914 are further described hereinbelow with reference to Table 1.

[12676] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM914 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12677] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 915 (GAM915) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12678] GAM915 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM915 was detected is described hereinabove with reference to Figs. 2-8.

[12679] GAM915 gene, herein designated GAM GENE, and GAM915 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12680] GAM915 gene, herein designated GAM GENE, encodes a GAM915 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM915 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM915 precursor RNA is designated SEQ ID:892, and is provided hereinbelow with reference to the sequence listing part.

[12681] GAM915 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM915 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12682] An enzyme complex designated DICER COMPLEX, dices the GAM915 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM915 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM915 RNA is designated SEQ ID:3494, and is provided hereinbelow with reference to the sequence listing part.

[12683] GAM915 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM915 target RNA, herein designated

GAM TARGET RNA. GAM915 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12684] GAM915 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM915 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM915 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM915 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM915 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12685] The complementary binding of GAM915 RNA, herein designated GAM RNA, to target binding sites on GAM915 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM915 target RNA, herein designated GAM

TARGET RNA, into GAM915 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12686] It is appreciated that GAM915 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM915 target genes. The mRNA of each one of this plurality of GAM915 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM915 RNA, herein designated GAM RNA, and which when bound by GAM915 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM915 target proteins.

[12687] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM915 gene, herein designated GAM GENE, on one or more GAM915 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12688] It is yet further appreciated that specific functions, and accordingly utilities, of GAM915 correlate with, and may be deduced from, the identity of the target

genes which GAM915 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12689] Nucleotide sequences of the GAM915 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM915 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM915 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM915 are further described hereinbelow with reference to Table 1.

[12690] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM915 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12691] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 916 (GAM916) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12692] GAM916 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM916 was detected is described hereinabove with reference to Figs. 2-8.

[12693] GAM916 gene, herein designated GAM GENE, and GAM916 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[12694] GAM916 gene, herein designated GAM GENE, encodes a GAM916 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM916 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM916 precursor RNA is designated SEQ ID:893, and is provided hereinbelow with reference to the sequence listing part.

[12695] GAM916 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM916 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12696] An enzyme complex designated DICER COMPLEX, dices the GAM916 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM916 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM916 RNA is designated SEQ ID:3495, and is provided

hereinbelow with reference to the sequence listing part.

[12697] GAM916 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM916 target RNA, herein designated GAM TARGET RNA. GAM916 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12698] GAM916 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM916 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM916 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM916 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM916 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12699] The complementary binding of GAM916 RNA, herein designated GAM RNA, to target binding sites on GAM916 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM916 target RNA, herein designated GAM TARGET RNA, into GAM916 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12700] It is appreciated that GAM916 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM916 target genes. The mRNA of each one of this plurality of GAM916 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM916 RNA, herein designated GAM RNA, and which when bound by GAM916 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM916 target proteins.

[12701] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM916 gene, herein designated GAM GENE, on one or more GAM916 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12702] It is yet further appreciated that specific functions, and accordingly utilities, of GAM916 correlate with, and may be deduced from, the identity of the target genes which GAM916 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12703] Nucleotide sequences of the GAM916 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM916 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM916 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM916 are further described hereinbelow with reference to Table 1.

[12704] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM916 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12705] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 917 (GAM917) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12706] GAM917 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM917 was detected is

described hereinabove with reference to Figs. 2-8.

[12707] GAM917 gene, herein designated GAM GENE, and GAM917 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12708] GAM917 gene, herein designated GAM GENE, encodes a GAM917 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM917 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM917 precursor RNA is designated SEQ ID:894, and is provided hereinbelow with reference to the sequence listing part.

[12709] GAM917 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM917 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12710] An enzyme complex designated DICER COMPLEX, dices the GAM917 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM917 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM917 RNA is designated SEQ ID:3497, and is provided hereinbelow with reference to the sequence listing part.

[12711] GAM917 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM917 target RNA, herein designated GAM TARGET RNA. GAM917 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12712] GAM917 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM917 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM917 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM917 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM917 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these

target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12713] The complementary binding of GAM917 RNA, herein designated GAM RNA, to target binding sites on GAM917 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM917 target RNA, herein designated GAM TARGET RNA, into GAM917 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12714] It is appreciated that GAM917 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM917 target genes. The mRNA of each one of this plurality of GAM917 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM917 RNA, herein designated GAM RNA, and which when bound by GAM917 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM917 target proteins.

[12715] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM917 gene, herein designated GAM GENE, on one or more GAM917 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes

are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12716] It is yet further appreciated that specific functions, and accordingly utilities, of GAM917 correlate with, and may be deduced from, the identity of the target genes which GAM917 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12717] Nucleotide sequences of the GAM917 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM917 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM917 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM917 are further described hereinbelow with reference to Table 1.

[12718] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM917 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12719] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 918 (GAM918) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12720] GAM918 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM918 was detected is described hereinabove with reference to Figs. 2-8.

[12721] GAM918 gene, herein designated GAM GENE, and GAM918 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12722] GAM918 gene, herein designated GAM GENE, encodes a GAM918 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM918 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM918 precursor RNA is designated SEQ ID:895, and is provided hereinbelow with reference to the sequence listing part.

[12723] GAM918 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM918 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12724] An enzyme complex designated DICER COMPLEX, dices the GAM918 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM918 RNA, herein designated GAM RNA, a single stranded

~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of GAM918 RNA is designated SEQ ID:3496, and is provided hereinbelow with reference to the sequence listing part.

[12725] GAM918 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM918 target RNA, herein designated GAM TARGET RNA. GAM918 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12726] GAM918 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM918 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM918 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM918 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM918 target RNA, herein designated GAM

TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12727] The complementary binding of GAM918 RNA, herein designated GAM RNA, to target binding sites on GAM918 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM918 target RNA, herein designated GAM TARGET RNA, into GAM918 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12728] It is appreciated that GAM918 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM918 target genes. The mRNA of each one of this plurality of GAM918 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM918 RNA, herein designated GAM RNA, and which when bound by GAM918 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM918 target proteins.

[12729] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM918 gene, herein designated GAM GENE, on one or more GAM918 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary

binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12730] It is yet further appreciated that specific functions, and accordingly utilities, of GAM918 correlate with, and may be deduced from, the identity of the target genes which GAM918 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12731] Nucleotide sequences of the GAM918 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM918 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM918 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM918 are further described hereinbelow with reference to Table 1.

[12732] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM918 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12733] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 919 (GAM919) gene, which modulates

expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12734] GAM919 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM919 was detected is described hereinabove with reference to Figs. 2-8.

[12735] GAM919 gene, herein designated GAM GENE, and GAM919 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12736] GAM919 gene, herein designated GAM GENE, encodes a GAM919 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM919 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM919 precursor RNA is designated SEQ ID:896, and is provided hereinbelow with reference to the sequence listing part.

[12737] GAM919 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM919 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12738] An enzyme complex designated DICER COMPLEX, dices the GAM919 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM919 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of GAM919 RNA is designated SEQ ID:3498, and is provided hereinbelow with reference to the sequence listing part.

[12739] GAM919 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM919 target RNA, herein designated GAM TARGET RNA. GAM919 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12740] GAM919 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM919 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM919 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an

illustration only, and is not meant to be limiting GAM919 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM919 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12741] The complementary binding of GAM919 RNA, herein designated GAM RNA, to target binding sites on GAM919 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM919 target RNA, herein designated GAM TARGET RNA, into GAM919 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12742] It is appreciated that GAM919 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM919 target genes. The mRNA of each one of this plurality of GAM919 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM919 RNA, herein designated GAM RNA, and which when bound by GAM919 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM919 target proteins.

[12743] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM919 gene, herein designated GAM GENE, on one or more

GAM919 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12744] It is yet further appreciated that specific functions, and accordingly utilities, of GAM919 correlate with, and may be deduced from, the identity of the target genes which GAM919 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12745] Nucleotide sequences of the GAM919 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM919 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM919 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM919 are further described hereinbelow with reference to Table 1.

[12746] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM919 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12747] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 920 (GAM920) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12748] GAM920 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM920 was detected is described hereinabove with reference to Figs. 2-8.

[12749] GAM920 gene, herein designated GAM GENE, and GAM920 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12750] GAM920 gene, herein designated GAM GENE, encodes a GAM920 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM920 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM920 precursor RNA is designated SEQ ID:897, and is provided hereinbelow with reference to the sequence listing part.

[12751] GAM920 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM920 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12752] An enzyme complex designated DICER COMPLEX, dices the GAM920 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM920 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of GAM920 RNA is designated SEQ ID:3499, and is provided hereinbelow with reference to the sequence listing part.

[12753] GAM920 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM920 target RNA, herein designated GAM TARGET RNA. GAM920 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12754] GAM920 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM920 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM920 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As

an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM920 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM920 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12755] The complementary binding of GAM920 RNA, herein designated GAM RNA, to target binding sites on GAM920 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM920 target RNA, herein designated GAM TARGET RNA, into GAM920 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12756] It is appreciated that GAM920 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM920 target genes. The mRNA of each one of this plurality of GAM920 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM920 RNA, herein designated GAM RNA, and which when bound by GAM920 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM920 target proteins.

[12757] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM920 gene, herein designated GAM GENE, on one or more GAM920 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12758] It is yet further appreciated that specific functions, and accordingly utilities, of GAM920 correlate with, and may be deduced from, the identity of the target genes which GAM920 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12759] Nucleotide sequences of the GAM920 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM920 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM920 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM920 are further described hereinbelow with reference to Table 1.

[12760] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic

representation of the complementarity of each of these target binding sites to GAM920 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12761] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 921 (GAM921) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12762] GAM921 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM921 was detected is described hereinabove with reference to Figs. 2-8.

[12763] GAM921 gene, herein designated GAM GENE, and GAM921 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12764] GAM921 gene, herein designated GAM GENE, encodes a GAM921 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM921 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM921 precursor RNA is designated SEQ ID:898, and is provided hereinbelow with reference to the sequence listing part.

[12765] GAM921 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM921 folded precursor RNA, herein designated GAM

FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12766] An enzyme complex designated DICER COMPLEX, dices the GAM921 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM921 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of GAM921 RNA is designated SEQ ID:3500, and is provided hereinbelow with reference to the sequence listing part.

[12767] GAM921 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM921 target RNA, herein designated GAM TARGET RNA. GAM921 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12768] GAM921 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM921

target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM921 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM921 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM921 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12769] The complementary binding of GAM921 RNA, herein designated GAM RNA, to target binding sites on GAM921 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM921 target RNA, herein designated GAM TARGET RNA, into GAM921 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12770] It is appreciated that GAM921 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM921 target genes. The mRNA of each one of this plurality of GAM921 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least

partly complementary to GAM921 RNA, herein designated GAM RNA, and which when bound by GAM921 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM921 target proteins.

[12771] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM921 gene, herein designated GAM GENE, on one or more GAM921 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12772] It is yet further appreciated that specific functions, and accordingly utilities, of GAM921 correlate with, and may be deduced from, the identity of the target genes which GAM921 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12773] Nucleotide sequences of the GAM921 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM921 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM921 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM921 are further described hereinbelow with

reference to Table 1.

[12774] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM921 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12775] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 922 (GAM922) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12776] GAM922 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM922 was detected is described hereinabove with reference to Figs. 2-8.

[12777] GAM922 gene, herein designated GAM GENE, and GAM922 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12778] GAM922 gene, herein designated GAM GENE, encodes a GAM922 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM922 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM922 precursor RNA is designated SEQ ID:899, and is provided

hereinbelow with reference to the sequence listing part.

[12779] GAM922 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM922 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12780] An enzyme complex designated DICER COMPLEX, dices the GAM922 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM922 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of GAM922 RNA is designated SEQ ID:3501, and is provided hereinbelow with reference to the sequence listing part.

[12781] GAM922 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM922 target RNA, herein designated GAM TARGET RNA. GAM922 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR

respectively.

[12782] GAM922 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM922 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM922 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM922 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM922 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12783] The complementary binding of GAM922 RNA, herein designated GAM RNA, to target binding sites on GAM922 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM922 target RNA, herein designated GAM TARGET RNA, into GAM922 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12784] It is appreciated that GAM922 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM922 target genes. The mRNA of each one of this plurality of GAM922 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM922 RNA, herein designated GAM RNA, and which when bound by GAM922 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM922 target proteins.

[12785] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM922 gene, herein designated GAM GENE, on one or more GAM922 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12786] It is yet further appreciated that specific functions, and accordingly utilities, of GAM922 correlate with, and may be deduced from, the identity of the target genes which GAM922 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12787] Nucleotide sequences of the GAM922 precursor RNA, herein designated

GAM PRECURSOR RNA, and of the diced GAM922 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM922 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM922 are further described hereinbelow with reference to Table 1.

[12788] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM922 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12789] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 923 (GAM923) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12790] GAM923 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM923 was detected is described hereinabove with reference to Figs. 2-8.

[12791] GAM923 gene, herein designated GAM GENE, and GAM923 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12792] GAM923 gene, herein designated GAM GENE, encodes a GAM923 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, GAM923 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM923 precursor RNA is designated SEQ ID:900, and is provided hereinbelow with reference to the sequence listing part.

[12793] GAM923 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM923 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12794] An enzyme complex designated DICER COMPLEX, dices the GAM923 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM923 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM923 RNA is designated SEQ ID:3502, and is provided hereinbelow with reference to the sequence listing part.

[12795] GAM923 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM923 target RNA, herein designated

GAM TARGET RNA. GAM923 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12796] GAM923 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM923 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM923 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM923 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM923 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12797] The complementary binding of GAM923 RNA, herein designated GAM RNA, to target binding sites on GAM923 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM923 target RNA, herein designated GAM

TARGET RNA, into GAM923 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12798] It is appreciated that GAM923 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM923 target genes. The mRNA of each one of this plurality of GAM923 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM923 RNA, herein designated GAM RNA, and which when bound by GAM923 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM923 target proteins.

[12799] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM923 gene, herein designated GAM GENE, on one or more GAM923 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12800] It is yet further appreciated that specific functions, and accordingly utilities, of GAM923 correlate with, and may be deduced from, the identity of the target

genes which GAM923 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12801] Nucleotide sequences of the GAM923 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM923 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM923 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM923 are further described hereinbelow with reference to Table 1.

[12802] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM923 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12803] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 924 (GAM924) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12804] GAM924 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM924 was detected is described hereinabove with reference to Figs. 2-8.

[12805] GAM924 gene, herein designated GAM GENE, and GAM924 target gene, herein designated GAM TARGET GENE, are human genes contained in the

human genome.

[12806] GAM924 gene, herein designated GAM GENE, encodes a GAM924 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM924 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM924 precursor RNA is designated SEQ ID:901, and is provided hereinbelow with reference to the sequence listing part.

[12807] GAM924 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM924 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12808] An enzyme complex designated DICER COMPLEX, dices the GAM924 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM924 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of GAM924 RNA is designated SEQ ID:3503, and is provided

hereinbelow with reference to the sequence listing part.

[12809] GAM924 target gene, herein designated GAM TARGET GENE, encodes a corresponding messenger RNA, GAM924 target RNA, herein designated GAM TARGET RNA. GAM924 target RNA, herein designated GAM TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[12810] GAM924 RNA, herein designated GAM RNA, binds complementarily to one or more target binding sites located in untranslated regions of GAM924 target RNA, herein designated GAM TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of GAM924 RNA, herein designated GAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the target binding sites. As an illustration, Fig. 8 shows 3 such target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of target binding sites shown in Fig. 8 is meant as an illustration only, and is not meant to be limiting GAM924 RNA, herein designated GAM RNA, may have a different number of target binding sites in untranslated regions of a GAM924 target RNA, herein designated GAM TARGET RNA. It is further appreciated that while Fig. 8 depicts target binding sites in the 3UTR region, this is meant as an example only these target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[12811] The complementary binding of GAM924 RNA, herein designated GAM RNA, to target binding sites on GAM924 target RNA, herein designated GAM TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of GAM924 target RNA, herein designated GAM TARGET RNA, into GAM924 target protein, herein designated GAM TARGET PROTEIN. GAM target protein is therefore outlined by a broken line.

[12812] It is appreciated that GAM924 target gene, herein designated GAM TARGET GENE, in fact represents a plurality of GAM924 target genes. The mRNA of each one of this plurality of GAM924 target genes comprises one or more target binding sites, each having a nucleotide sequence which is at least partly complementary to GAM924 RNA, herein designated GAM RNA, and which when bound by GAM924 RNA, herein designated GAM RNA, causes inhibition of translation of respective one or more GAM924 target proteins.

[12813] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 8 with specific reference to translational inhibition exerted by GAM924 gene, herein designated GAM GENE, on one or more GAM924 target gene, herein designated GAM TARGET GENE, is in fact common to other known miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[12814] It is yet further appreciated that specific functions, and accordingly utilities, of GAM924 correlate with, and may be deduced from, the identity of the target genes which GAM924 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[12815] Nucleotide sequences of the GAM924 precursor RNA, herein designated GAM PRECURSOR RNA, and of the diced GAM924 RNA, herein designated GAM RNA, and a schematic representation of the secondary folding of GAM924 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, of GAM924 are further described hereinbelow with reference to Table 1.

[12816] Nucleotide sequences of target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 8, found on, and schematic representation of the complementarity of each of these target binding sites to GAM924 RNA, herein designated GAM RNA, are described hereinbelow with reference to Table 2.

[12817] Fig. 8 further provides a conceptual description of another novel bioinformatically detected gene of the present invention, referred to here as Genomic Address Messenger 925 (GAM925) gene, which modulates expression of respective target genes thereof, the function and utility of which target genes is known in the art.

[12818] GAM925 is a novel bioinformatically detected regulatory, non protein coding, micro RNA (miRNA) gene. The method by which GAM925 was detected is

described hereinabove with reference to Figs. 2-8.

[12819] GAM925 gene, herein designated GAM GENE, and GAM925 target gene, herein designated GAM TARGET GENE, are human genes contained in the human genome.

[12820] GAM925 gene, herein designated GAM GENE, encodes a GAM925 precursor RNA, herein designated GAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, GAM925 precursor RNA, herein designated GAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of GAM925 precursor RNA is designated SEQ ID:902, and is provided hereinbelow with reference to the sequence listing part.

[12821] GAM925 precursor RNA, herein designated GAM PRECURSOR RNA, folds onto itself, forming GAM925 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[12822] An enzyme complex designated DICER COMPLEX, dices the GAM925 folded precursor RNA, herein designated GAM FOLDED PRECURSOR RNA, into GAM925 RNA, herein designated GAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is

catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of GAM925 RNA is designated SEQ ID:3504, and is provided hereinbelow with reference to the sequence listing part.
